CASIO Comments on Energy Star Imaging Equipment Version 1.1 Draft 2

[1] Background

Reduction of electricity consumption is a must to prevent global warming. We are working on reduction of energy consumption. Above all, equipment's standby power is not ignorable. In our office, equipment like printers are turned off during night time and on weekends.

[2] Our comment on Version1.1 Draft2

We agree to lower standard TEC value.
However, we have a particular comment about measurement.

<Comment on measurement>

We believe devices that reduce standby power at night and on weekends should be popularized.
To realize that, devices having automatic power off function should be approved to use its function to measure the TEC value. That is, waste of energy can be prevented by using a timer that shuts off the equipment automatically at night and on weekends. Though it is necessary to turn on the equipment manually when it is used, we believe this method is really effective.

We would like you to consider it to prevent the global warming.
