

Dear Mr. Anderson,

I take exception with the uniform u value suggested for all climatic zones. Throughout their histories NFRC and Energy Star have gone to great lengths to identify the diversities that make up the climate of the US. The universal u value seems to be an effort to allow the major national fenestration companies to produce a “one size fits all” product at the expense of producing appropriate products for each zone. This hardly presents a “most efficient” result. I suggest the regional approach allows for the most competition and produces a better result in that products will be more affordable and available

Thank you for your consideration,

Richard Kennel
