

Join EPA in protecting the climate.

ENERGY STAR® qualified products and practices help you save energy, save money, and protect the environment.

HVAC System

Have your system inspected by a heating and cooling contractor before heating and cooling seasons. Nearly half of the average home's energy costs go toward heating and cooling. Making smart decisions about your home's HVAC system can have a big effect on your utility bills. When replacing your heating and cooling equipment, look for the ENERGY STAR.

Programmable Thermostat

Install and properly use a programmable thermostat to cut yearly energy costs. Learn more at energystar.gov/pts.

Air Filter

Change your filter at least every three months to improve air quality and flow.

Debris

Keep outdoor components clear of leaves and debris.

Seal and Insulate

Sealing and insulating the "envelope" of your home—its outer walls, ceilings, windows, doors, and floors—is often the most cost-effective way to improve energy efficiency and comfort.

Take the U.S. Environmental Protection Agency's ENERGY STAR Pledge at energystar.gov/changetheworld.
