Following is the Version 5.0 ENERGY STAR product specification for Set-top Boxes (STBs). A product shall meet all of the identified criteria to earn the ENERGY STAR.

1 DEFINITIONS

A) Set-top Box (STB): A device combining hardware components with software programming designed for the primary purpose of receiving television and related services from terrestrial, cable, satellite, broadband, or local networks and providing video output using at least one direct video connection.

B) Displayless Video Gateway (DVG): A device combining hardware components with software programming designed for the primary purpose of receiving television and related services from terrestrial, cable, satellite, broadband, or local networks and providing video without any direct video connection.

Note: EPA is considering combining the DVG and STB definitions and replacing it with a single STB product category, for simplicity, EPA welcomes feedback on this proposal. Also, EPA welcomes feedback on how to continue differentiating between gateways and products covered under the ENERGY STAR specification for Small Network Equipment. In particular, EPA believes there may be uncertainty in classifying MVPD IP gateways. One possible means of clarifying would be to include in this specification a capacity minimum for data (i.e., Mbps/sec). EPA seeks feedback on the appropriate capacity minimum for gateways covered by the ENERGY STAR STB specification. EPA has included the relevant ENERGY STAR SNE definitions for reviewers’ consideration along with this proposal regarding capacity.

2) Small Network Equipment (SNE): Network Equipment that is intended to serve users in either small networks or a subset of a large network. SNE includes a) all Network Equipment with integral wireless capability and b) other Network Equipment meeting all of the following criteria:

   a) Designed for stationary operation;
   b) Contains no more than eleven (11) wired Physical Network Ports;
   c) Primary configuration for operation outside of standard equipment racks;
   d) Meets the definition of one or more of the Product Types defined below.

B) Small Network Equipment Types:

1) Broadband Access Equipment

   a) Broadband Modem: A device that transmits and receives digitally-modulated analog signals over a wired or optical network as its primary function. The Broadband Modem category does not include devices with integrated Router, Switch, or Access Point functionality.

   b) Integrated Access Device (IAD): A network device with a modem and one or more of the following functions: wired network routing, multi-port Ethernet switching and/or access point functionality.

   c) Optical Network Termination Device (ONT): A type of device that converts signals between copper (wired) or wireless connections and an optical fiber connection. ONTs are available in either desktop or building-mounted versions with different connectivity options.

---

C) **Product Type (Base Type):** The means of access to video content for a STB or DVG.

1) **Cable:** A STB or DVG that can receive television signals from a broadband, hybrid fiber/coaxial, or community cable distribution system with Conditional Access (CA) or a STB or DVG capable of receiving cable service after installation of a CableCARD or other type of Conditional Access system.

2) **Satellite:** A STB or DVG that can receive and decode video content as delivered from a MVPD satellite network.

3) **Cable Digital Transport Adapter (DTA):** A minimally-configured Cable STB that can receive television signals from a broadband, hybrid fiber/coaxial, or community cable distribution system.

4) **Internet Protocol (IP):** A STB or DVG that can receive television/video signals encapsulated in IP packets.
   - i) **Over-the-top (OTT) Internet Protocol (IP):** An IP STB that cannot receive signals from a Multichannel Video Programming Distributor (MVPD) as defined in Title 47 U.S. Code § 522.
   - ii) **Multichannel Video Programming Distributor (MVPD) Internet Protocol (IP):** An IP STB or DVG that can receive signals from a MVPD.

---

**Note:** EPA has removed the definition for Terrestrial due to lack of market availability of these set-top boxes.

5) **Thin-client/Remote:** A STB that can receive content over an HNI from another STB or DVG, but is unable to interface directly to the MVPD network.

---

D) **Additional Functionality:**

1) **CableCARD:** The capability to decrypt premium audio/video content and services and provide other network control functions via a plug-in Conditional Access module that complies with the ANSI/SCTE 28 HOST-POD Interface Standard¹.

**Note:** EPA requests information on how quickly the industry expects to transition away from CableCARD.

2) **Digital Video Recorder (DVR):** A feature that records television signals on a hard disk drive (HDD) or other non-volatile storage device integrated into the STB or DVG for playback at an arbitrary time. A DVR includes features such as: Play, Record, Pause, Fast Forward (FF), and Fast Rewind (FR). STBs or DVGs that only support buffering or a Service Provider network-based

---

¹ [http://www.scte.org/standards/](http://www.scte.org/standards/)
“DVR” service are not considered DVR STBs or DVGs for purposes of this specification. The presence of DVR functionality does not mean the device is defined to be a STB or DVG.

3) **DOCSIS®**: The capability to distribute data and audio/video content over cable television infrastructure in accordance with the CableLabs® Data Over Cable Service Interface Specification.

4) **Home Network Interface (HNI)**: An interface with external devices over a local area network (example: Institute of Electrical and Electronics Engineers (IEEE) 802.11 (Wireless-Fidelity or Wi-Fi), Multimedia over Coax Alliance (MoCA), HomePNA alliance (HPNA), IEEE 802.3, HomePlug AV) that is capable of transmitting video content.

   i) **Multi-Input Multi-Output (MIMO) Wireless HNI**: IEEE 802.11n/ac and related MIMO enabled Wi-Fi functionality that supports more than one spatial stream in both send and receive. When using the notation MIMO AxB: A is considered the number of spatial streams while B is the number of antennas supported. A spatial stream is an independent and separately encoded data signal.

5) **Multi-room**: The capability to provide independent live audio/video content to two or more Clients or support pause/time-shifting capability for otherwise standalone IP or Thin-client STBs within a single family living unit. This definition does not include the capability to manage gateway services for multi-subscriber scenarios.

   **Note**: EPA is proposing to clarify the definition for Multi-room by specifying that support for two or more clients is required, rather than providing a parenthetical note, as in Version 4.1.

6) **Multi-stream**: A STB or DVG feature that allows the device to receive multiple independent streams of video content for use with one or more Clients, one or more directly connected Display Devices, or a DVR, picture-in-picture, etc. This definition does not include the capability to manage gateway services for multi-subscriber scenarios.

   **Note**: EPA clarified that Multi-stream is also used for picture-in-picture capability and welcomes comments on further uses of this functionality.

7) **Ultra HD (4k) Resolution**: The capability to transmit or display video signals with a minimum output resolution of 3840×2160 pixels in progressive scan mode at minimum frame rate of 24 fps (abbreviated 2160p24).

8) **High Efficiency Video Processing**: Video decoding providing compression efficiency significantly higher than H.264/AVC, for example HEVC (H.265).

9) **Three-dimensional (3D) Capability**: The capability to transmit or display video signals with 3D depth information for stereoscopic display.

10) **Access Point**: The capability to provide wireless network connectivity to multiple clients. For the purposes of this specification, Access Point functionality includes only IEEE 802.11 (Wi-Fi) connectivity.

11) **Router**: The capability to determine the optimal path along which network traffic should be forwarded. Routers forward packets from one network to another based on network layer information. Router functionality includes Access Point functionality.

12) **Telephony**: The ability to support analog telephones through one or more RJ11 or RJ14 jacks.

   **Note**: EPA has clarified that this adder refers to supporting analog telephones, rather than a service, since the majority of all telephone service is digital.

2 http://www.cablelabs.com/specs/
13) Transcoding: Additional capability to translate (e.g., MPEG2 to H.264), transrate (e.g., HD bitrate to Mobile bitrate), transcale (e.g., HD resolution to Mobile resolution), transcrypt (e.g., CAS to DRM), or perform audio format conversions (e.g., AC-3 to AAC) in real-time.

**Note:** Due to the additional system requirements to perform transcoding, EPA is proposing an allowance for this functionality and has therefore provided a definition, harmonized with the Tier 2 Program Requirements of the Industry Voluntary Agreement for Ongoing Improvement to the Energy Efficiency of Set-top Boxes (the VA).

E) Auto Power Down (APD): A STB or DVG feature that monitors parameters correlated with the user activity or viewing. If the parameters collectively indicate that no user activity or viewing is occurring, the APD feature enables the STB or DVG to transition to Sleep Mode.

F) Principal Function: Functions necessary for selecting (via electronic program guide), receiving, decoding, decompressing, or delivering live or recorded audio/video content to a Display Device, local/remote recording device, or Client. Monitoring for user or network requests is not considered a Principal Function for STBs or DVGs.

G) Operational Modes:

1) **On Mode:** The STB or DVG is connected to a power source. At least one Principal Function is activated and all Principal Functions are provisioned for use. The power draw in On Mode may vary based on specific use and configuration.

2) **Sleep Mode:** A range of reduced power states where the STB or DVG is connected to a power source and is not providing any Principal Function. The STB or DVG may transition to On Mode due to user action, internal signal, or external signal. The power drawn in this mode may vary based on specific use or configuration. If any Principal Function is activated while operating in this mode, the STB or DVG is assumed to transition to On Mode. Monitoring for user or network requests is not considered a Principal Function. The STB or DVG shall be able to transition from this mode to On Mode within 30 seconds to be considered in Sleep Mode.

3) **Deep Sleep State:** A power state characterized by reduced power draw that provides additional energy savings.

H) Other Definitions

1) **Display Device (DD):** A device (e.g., TV, Computer Monitor, or Portable TV) that receives its content directly from a STB through a video interface (example: High-Definition Multimedia Interface (HDMI), Component Video, Composite Video, or S-Video), not through a HNI, and displays it for viewing.

2) **Client:** A device (e.g., STB, Thin-Client STB, Smart TV, Mobile Phone, Tablet, PC, etc.) that can receive content over a HNI from another STB or DVG.

3) **External Power Supply (EPS):** Also referred to as External Power Adapter. An external power supply circuit that is used to convert household electric current into dc current or lower-voltage ac current to operate a consumer product.

4) **Standard dc:** A method for transmitting dc power defined by a well-known technology standard, enabling plug-and-play interoperability.

   **Note:** Common examples are Universal Serial Bus (USB) and Mobile High-definition Link (MHL). Usually Standard dc includes both power and communications over the same cable but that is not required.

**Note:** EPA included a new definition for standard dc power, based on the definition in the Version 7.0 Displays specification. This definition, proposed changes throughout the specification, and future updates to the Test Method will permit testing and qualification of STBs powered by standard dc.

5) **Service Provider:** A business entity that provides video content, a delivery network, and associated installation or support services to subscribers with whom it has an ongoing contractual relationship. Equivalent with Multichannel Video Program Distributors (MVPDs).
Note: EPA has clarified that service providers include MVPDs for the purposes of this specification. However, since many of the requirements of the specification also apply to over-the-top IP STBs, EPA has clarified how to apply requirements to OTT IP boxes throughout the specification.

6) Conditional Access: The encryption, decryption, and authorization techniques employed to protect content from unauthorized viewing. CableCARD and Downloadable Conditional Access System (DCAS) are examples of Conditional Access technology.

7) Typical Energy Consumption (TEC): A means for evaluating energy efficiency through a calculation of expected energy consumption for a typical household over a one year period, expressed in units of kWh/year.

8) Unit Under Test (UUT): The STB or DVG being tested.

I) Product Family: A group of product models that are (1) made by the same manufacturer, (2) subject to the same ENERGY STAR certification criteria, and (3) of a common basic design. Product models within a family differ from each other according to one or more characteristics or features that either (1) have no impact on product performance with regard to ENERGY STAR qualification criteria, or (2) are specified herein as acceptable variations within a product family. For Set-top Boxes, acceptable variations within a product family include:

1) Aesthetic housing changes that do not affect the thermal characteristics of the device (e.g., color, labeling, or other cosmetic modifications); and

2) Software configuration.

2 SCOPE

2.1 Included Products

2.1.1 Products that meet the definition of Set-top Box or Displayless Video Gateway, and a Set-top Box Base Type as specified herein are eligible for ENERGY STAR certification, with the exception of products listed in Section 2.2.

2.2 Excluded Products

2.2.1 Products that are covered under existing ENERGY STAR product specifications are not eligible for qualification under the STB specification. The list of specifications currently in effect can be found at [www.energystar.gov/specifications](http://www.energystar.gov/specifications).

3 QUALIFICATION CRITERIA

3.1 Significant Digits and Rounding

3.1.1 All calculations shall be carried out with directly measured (unrounded) values.

3.1.2 Unless otherwise specified, compliance with specification limits shall be evaluated using directly measured or calculated values without any benefit from rounding.

3.1.3 Directly measured or calculated values that are submitted for reporting on the ENERGY STAR website shall be rounded to the nearest significant digit as expressed in the corresponding specification limit.

3.2 General Qualification Criteria

3.2.1 External Power Supply (EPS): Single- and Multiple-voltage EPSs shall meet the Level VI or higher performance requirements under the International Efficiency Marking Protocol when tested.
according to the Uniform Test Method for Measuring the Energy Consumption of External Power
Supplies, Appendix Z to 10 CFR Part 430.

i. Single- and Multiple-voltage EPSs shall include the Level VI or higher marking.

ii. Additional information on the Marking Protocol is available

**Note:** EPA has updated the EPS requirements to reflect the new DOE standard going into effect in 2016,
which requires a Level VI efficiency for both single- and multiple-voltage EPSs.

### 3.2.2 Maintenance Activities:

i. Products may automatically exit Sleep Mode and/or Deep Sleep State on a regular schedule
to download content, scan for program and schedule information, and perform maintenance
activities. The total time spent performing maintenance activities shall not exceed an average
of two hours in any 24-hour period, exclusive of activities scheduled by the end-user (e.g.,
video recording of a regularly scheduled program). Video downloads that are not user-requested
(e.g., “speculative recording”, or “push”) shall be counted against the two hour
average per day requirement.

ii. Products that have exited Sleep Mode or Deep Sleep State and completed maintenance or
other user-requested activities shall automatically return to Sleep Mode or Deep Sleep State
in less than 15 minutes.

iii. Products that provide a speculative recording function shall provide a user-accessible menu
option to permit users to disable the functionality. Instructions for disabling speculative
recording shall be included in printed and/or electronic product manuals.

### 3.2.3 Auto Power Down (APD): To apply “YES” in Table 1 Operational Mode Durations for Column 1
“APD Enabled by Default,” products shall meet the following requirements:

i. Products shipped with software from the manufacturer shall ship with APD enabled by
default, with APD timing set to engage after a period of less than or equal to 4 hours from last
user activity. User activity is defined as any activity in which the user interacted with the UUT.
The Emergency Alert System (EAS) system can wake the box and should also be considered
user activity for the purposes of this requirement.

**Note:** Based on stakeholder questions on the Version 4.1 specification, EPA has added the above
clarification on APD timing.

ii. Otherwise, the default software download from the Service Provider or manufacturer shall set
APD timing to engage after a period of inactivity less than or equal to 4 hours.

iii. All energy-related default settings shall persist until an end-user chooses to manually either
(1) disable APD, or (2) modify the default settings.

### 3.2.4 Deep Sleep State: To apply “YES” in Table 1 Operational Mode Durations for Column 2
“Automatic Deep Sleep,” products shall meet the following requirements:

i. A means of activating Deep Sleep shall be present and may include clearly marked button(s)
or switch(es) on the remote control that shall begin activation of Deep Sleep within 2 seconds
of being pressed and within two button presses. Additionally, Deep Sleep shall be activated
via a user-controllable timer or network stimulus. Alternative button configurations or methods
of reaching Deep Sleep will be acceptable with written approval from EPA.

ii. Products shipped with software from the manufacturer shall ship with Deep Sleep enabled by
default.

iii. Otherwise, the default software download from the Service Provider or manufacturer shall
enable Deep Sleep.
iv. Deep Sleep functionality shall not prevent a device from performing a user-scheduled DVR recording or other function.

v. Conversely, a user-scheduled DVR recording or other function shall not prevent a device from entering and remaining in Deep Sleep, except during the time required to perform the DVR recording or other function, and 15 minutes before and after the time required.

vi. An override function may be provided to allow the end-user to disable Deep Sleep functionality; however, users shall first be offered an explanation of the Deep Sleep feature and provided the opportunity to change the schedule to better suit their needs.

vii. After the end of Deep/scheduled Sleep time, the STB must resume Sleep Mode functionality including the ability to transition to On Mode in 30 seconds or less.

Note: EPA seeks feedback on current and forthcoming approaches to deep sleep and ways to simplify and update these requirements to align with the market while continuing to make consumer access to deep sleep activation straightforward.

3.3 Typical Energy Consumption (TEC) Requirements

3.3.1 For STBs, TEC as determined per the test procedure, multiplied by a factor relating to the client-only incentive, shall be less than or equal to the Maximum TEC Specification Requirement (TECMAX), as illustrated in Equation 1.

Equation 1: TEC Requirement for STBs

\[(1 - \text{Incentive}_{\text{CLIENT, ONLY}}) \times TEC + \text{eff}_{\text{ac-dc}} \leq TEC_{\text{MAX}} = TEC_{\text{BASE}} + \sum_{i=1}^{n} TEC_{\text{ADDL,i}}\]

Where:
- TEC is the Typical Energy Consumption, as calculated in Equation 3;
- Incentive\text{CLIENT, ONLY} is an incentive for Multi-room STBs, as specified in Section 3.3.4;
- eff\text{ac-dc} is the standard adjustment for ac-dc power conversion losses that occur at the device powering the STB, and is 1.0 for Ac-powered STBs and 0.85 for STBs with Standard dc;
- TEC\text{MAX} is the maximum TEC Specification Requirement—the level for ENERGY STAR certification;
- TEC\text{BASE} is the topmost applicable Base Type TEC Allowance (kWh), as specified in Table 2; and
- TEC\text{ADDL,i} is each applicable Additional Functionality TEC Allowance (kWh), as specified in Table 3, applied once per functionality and subject to the requirements in Section 3.3.3, below.

Note: EPA has included an ac-dc conversion factor to account for any power conversion losses in the product (such as a television) that is powering a dc-powered STB, and put ac- and dc-powered STBs on an even playing field. EPA welcomes feedback whether the proposed 85% conversion factor is representative of typical conversion losses. EPA is not proposing a similar dc conversion factor for Displayless Video Gateways, as it expects those highly-featured products to be exclusively ac-powered. EPA requests comments on this assumption.

Also, EPA has received feedback that Multi-room STBs already decrease energy consumption when transmitting content to clients rather than the display, such that the incentive may not be necessary. EPA welcomes feedback on this topic.

3.3.2 For Displayless Video Gateways (DVGs), TEC as determined per the test procedure shall be less than or equal to the Maximum TEC Specification Requirement (TECMAX), as illustrated in Equation 2.
Equation 2: TEC Requirement for Displayless Video Gateways (DVGs)

\[
TEC \leq TEC_{\text{MAX}} = TEC_{\text{BASE}} + \sum_{i=1}^{n} TEC_{\text{ADDL,i}}
\]

Where:
- \(TEC\) is the Typical Energy Consumption, as calculated in Equation 3;
- \(TEC_{\text{MAX}}\) is the maximum TEC Specification Requirement—the level for ENERGY STAR qualification;
- \(TEC_{\text{BASE}}\) is the topmost applicable Base Type TEC Allowance (kWh), as specified in Table 2; and
- \(TEC_{\text{ADDL,i}}\) is each applicable Additional Functionality TEC Allowance (kWh), as specified in Table 3, applied once per functionality and subject to the requirements in Section 3.3.3, below.

Equation 3: TEC Calculation

\[
TEC = 0.365 \left[ (T_{\text{WATCH,TV}} \times P_{\text{WATCH,TV}}) + (T_{\text{SLEEP}} \times P_{\text{SLEEP}}) + (T_{\text{APD}} \times P_{\text{APD,ON TO SLEEP}}) + (T_{\text{DEEP SLEEP}} \times P_{\text{SLEEP SP 2}}) \right]
\]

Where:
- \(T_{\text{WATCH,TV}}\) is the time coefficient for On Mode, as determined per Table 1;
- \(P_{\text{WATCH,TV}}\) is the measured power in On Mode (W);
- \(T_{\text{SLEEP}}\) is the time coefficient for Sleep Mode, as determined per Table 1;
- \(P_{\text{SLEEP}}\) is the measured power in Sleep Mode (W);
- \(T_{\text{APD}}\) is the time coefficient for APD, as determined per Table 1;
- \(P_{\text{APD,ON TO SLEEP}}\) is the measured power after an APD timeout (W);
- \(T_{\text{DEEP SLEEP}}\) is the time operating in Deep Sleep State (maximum of 4h); and
- \(P_{\text{SLEEP SP 2}}\) is the measured power in the automatically scheduled Deep Sleep State (W).

</tr>
</tbody>
</table>

**Note:** As the efficiency across all base types has improved and Cable STB manufacturers are shipping models without CableCARD, EPA proposes to set a single base allowance for all STBs that connect to an MVPD network (Cable DTA, Cable, Satellite, and MVPD IP) and address any differences through functional adder allowances, addressed in the next section.

The combination of base and adder allowances presented in Draft 1 allows a varied selection of products across the different base types and functionalities to qualify, including models with DVR, HNI (wired and wireless), and MR functionality.

EPA has also removed the base allowance for Terrestrial STBs due to the lack of market availability of those products.

EPA welcomes comment on this approach, including component-level data that would support any differences in the base allowances.

3.3.3 Additional Functionality TEC Allowances (TEC\textsubscript{ADDL\_i}) shall be as specified in Table 3, subject to the following requirements:

i. No additional functionality allowances may be applied to STBs with CABLE DTA base functionality.

ii. The HOME NETWORK INTERFACE and MIMO Wi-Fi HNI, UltraHD Resolution, and TC HEVP allowances are the only additional functionality allowances that may be applied to STBs with THIN CLIENT / REMOTE base functionality.

iii. The CableCARD allowance may only be applied at most twice per STB or DVG.

iv. The DOCSIS 3 allowances may only be applied to STBs or DVGs that are installed in a Service Provider network with DOCSIS capability.

v. The MULTI-ROOM allowance may only be applied once per STB or DVG, regardless of the number of remote outputs served by the STB or DVG.

vi. The MULTI-ROOM allowance may only be applied to STBs or DVGs that can provide live audio/video content to multiple devices (2 or more Clients) or support pause/time-shifting capability for otherwise standalone IP or Thin-client STBs.

vii. The MULTI-ROOM allowance may not be combined with the HOME NETWORK INTERFACE allowance on a single STB or DVG.

viii. The MIMO Wi-Fi HNI allowance can only be combined with HOME NETWORK INTERFACE or MULTI-ROOM allowance and only when the device is tested with Wi-Fi as the HOME
NETWORK INTERFACE providing the primary video transport from the MULTI-ROOM STB or DVG to the device. It cannot be used at any other time and must be used in conjunction with the HOME NETWORK INTERFACE or MULTI-ROOM allowance.

ix. Either the ROUTER or ACCESS POINT allowance may be applied once per STB or DVG, and must be combined with the HOME NETWORK INTERFACE or MULTI-ROOM allowance.

x. The HEVP and TC HEVP allowances may only be applied to STBs that provide an UltraHD output through decoding an UltraHD stream or upscaling an HD stream per the Test Method. They may not be applied to DVGs.⁴

Note: EPA is proposing to revise the above rules for simplicity and to account to the changes to adders, below. Specifically, EPA has clarified that the CableCARD adder can be applied twice, consistent with the VA, and has removed instructions on applying the multi-stream and DOCSIS 2 allowance (set to 0 kWh in Table 3, below.

</tbody>
</table>

³ The HEVP allowances cover the decoding of HEVC video for display. Since DVGs are not tested with a local display, they are expected to rely on client STBs to perform decoding and therefore do not qualify for these allowances.
Additional Functionality | Allowance (kWh/year)
--- | ---
Access Point | 5
Router | 10
Telephony | 4

**Note:** EPA is proposing updated allowances for several additional functionalities due to continuing efficiency improvements. To determine the energy impact of each allowance, EPA constructed a dataset of 138 current models based on the ENERGY STAR certified product list, supplemented with models publicly reported by Service Providers under the VA. The energy contribution of each adder was then estimated through multivariate regressions, which compared the On Mode power and TEC of models with and without each adder.

EPA confirmed the robustness of these estimates by performing regressions across the entire dataset and individual base types, step-wise regressions with different combinations of adders (to identify those that were most likely to explain the variation in power of the models), and cross-correlation analyses of the adders themselves to identify adders that are typically used together. The last step prompted EPA to consolidate the allowance for Multi-stream with either DVR or MR, simplifying the table. Finally, EPA validated the results by discussing current and forthcoming functionality with industry stakeholders to ensure that it was not ignoring any features or trends. The results of the analysis are as follows:

**AVP, HD:** Provided for comparison with the VA, but no allowance proposed as AVP functionality necessary for receiving HD video is a standard feature, which should be accounted for by the base allowance.

**CableCARD:** Although Cable STB manufacturers can provide conditional access through software, without CableCARD and similar to other base types, most current Cable STBs continue to use it. EPA’s regression analysis of VA data returned allowances ranging between 26 and 30 kWh/yr (both significant with <0.05 probability that the result occurred by chance), depending whether just the Cable or all STBs were analyzed. As the number of CableCARDs contained in the STBs claiming the adder is unknown, EPA is proposing the same allowance as in the VA: 15 kWh for the first CableCARD and 15 kWh for up to one additional CableCARD, for a potential total of 30 kWh. EPA also welcomes feedback on this proposal, typical energy consumption of CableCARD (separate from the base Cable STB functionality), and expected timing of deployment of models without CableCARD and the potential savings due to this transition.

**DVR:** EPA’s regression analysis returned allowances ranging between 27 and 126 kWh/yr, many significant, depending whether ENERGY STAR or VA data were analyzed, and whether Cable, Satellite, or MVPD IP STBs were analyzed separately or jointly. EPA is proposing to retain the current allowance of 45 kWh, which is close to the average of the DVR estimates and aligns with the VA.

**DOCSIS:** Regression analysis did not result any significant estimates for the DOCSIS 2 allowance, so EPA is proposing to reduce the DOCSIS 2 allowance to zero, to recognize the leadership of transitioning to the higher performance and expected lower power DOCSIS 3 standard (which supports a low-power 1x1 mode). To this end, EPA is proposing to continue the 11 kWh allowance for DOCSIS 3, included in the Version 4.1 specification. EPA welcomes feedback on the DOCSIS 2 to DOCSIS 3 transition, as well as whether the proposed DOCSIS 3 and CableCARD adders fully account for Cable STBs’ need to directly communicate with the head-end (in contrast to IP and Satellite which use additional equipment in the form of low-noise block (LNBs) downconverters and optical network terminals (ONTs), respectively).

**HEVP, HEVP-TC, and UHD:** EPA is not proposing any changes to the allowances for these new functions due to their currently limited penetration in the market, but has rearranged the name of the thin-client HEVP adder to allow it to be alphabetized with HEVP.
HNI: EPA's regression analysis returned allowances ranging between 5 and 36 kWh/yr, depending on the subset of STBs analyzed, with estimates of 20 and 36 kWh considered significant (<0.05 probability that the result occurred by chance). Since these results are similar to the allowances currently provided under Version 4.1, EPA is not proposing any changes and maintaining a single technology-neutral HNI allowance, with the MIMO HNI adder recognizing the additional flexibility provided by wireless technology.

MIMO HNI: Regression estimates for MIMO Wi-Fi HNI were 27 kWh for 2.4 GHz and 22 for 5 GHz (unknown number of spatial streams). These results were not considered significant partly due to the limited number of STBs currently supporting MIMO. Based on the energy consumption of recently tested small networking equipment (routers and access devices), EPA is proposing to reduce the MIMO allowance to 2 kWh/yr per 2.4 GHz stream and 5 kWh/yr per 5 GHz stream.

Multi-room: EPA's regression analysis returned allowances ranging between 3 and 56 kWh/yr, again depending on the subset of STBs analyzed, with estimates of 22, 26, 32 and 56 kWh considered significant (<0.05 probability that the result occurred by chance). EPA is proposing a revised allowance of 35 kWh which is approximately the average of those values.

Multi-stream: Due to the overlap between Multi-stream and other functions (DVR, HNI, MR), EPA is proposing to consolidate. The adder was removed from the regression analysis and any additional allowance was distributed among the remaining adders. Although EPA understands that there are some cases where STBs support Multi-stream without DVR or Multi-room (e.g., for picture-in-picture capability), there is a limited number of set-top boxes in this situation and the advent of full-band tuners should permit tuning multiple channels without the energy overhead. EPA welcomes feedback on this proposal.

Transcoding: EPA's regression analysis returned allowances ranging between 24 and 30 kWh/yr, depending on the subset of STBs analyzed, with the 30 kWh estimate considered significant (<0.05 probability that the result occurred by chance). It is unclear how many transcoding streams were used during the test for the VA models claiming this allowance (all Cable Multi-room DVRs); however, if several streams are used, then the VA's allowance of 13 kWh for the capability with 5 kWh for each additional stream would appear appropriate. EPA welcomes feedback on this proposal.

Access Point, Router, Telephony: No STBs in the dataset supported these features. Nonetheless, EPA is continuing to expect gateway STBs with this functionality to emerge. Based on recent EPA tests of commercially available routers and access points, EPA is proposing to reduce the allowances to 5 kWh/yr for Access Point and 10 kWh for Router. As noted, a product cannot claim both the Router and Access Point allowance. No change is proposed for Telephony.

EPA has also added placeholders for the following adders even though it is not providing allowances, to ease comparison with the VA:
- Advanced Video Processing
- Advanced Video Processing – Additional
- HD
- Multi-stream – Additional

Finally, EPA has alphabetized the adders for easier reference, with the exception of the networking adders, which are grouped together.

3.3.4 Client Only Incentive: Multi-room STBs can receive an incentive for use in Equation 1 by going into a lower-power state while continuing to provide video to their connected clients, as calculated in Equation 4. Note, because DVGs lack a connected Display Device, they always operate in Client Only mode (measured in the Test Method). Therefore, this incentive applies only to STBs and not DVGs.
Equation 4: Calculation of Client Only Incentive for Multi-room STBs

\[
\text{Incentive}_{\text{CLIENT\_ONLY}} = \frac{P_{\text{WATCH\_TV}} - P_{\text{CLIENT\_ONLY}}}{P_{\text{WATCH\_TV}}},
\]

Where:
- \( \text{Incentive}_{\text{CLIENT\_ONLY}} \) is the Client Only Incentive applicable to Multi-room STBs;
- \( P_{\text{WATCH\_TV}} \) is the measured power in On Mode (W) for Multi-room STBs; and
- \( P_{\text{CLIENT\_ONLY}} \) is the Sleep Mode Power as measured in the Test Method.

Note: Products intended for sale in the US market are subject to minimum toxicity requirements. Please see ENERGY STAR® Program Requirements for Set-top Boxes: Partner Commitments for details.

4 TESTING

4.1 Test Methods

4.1.1 Test methods identified in Table 4 shall be used to determine energy consumption.

<table>
<thead>
<tr>
<th>Product Type</th>
<th>Test Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>STBs and Displayless Video Gateways (DVGs)</td>
<td>TBD</td>
</tr>
</tbody>
</table>

Note: The U.S. Department of Energy (DOE) and EPA are revisiting the test method, which will be released as part of a separate announcement, shortly. The test requirements which were previously part of Section 4, Testing, will now be part of the revised test method.

4.2 Certification Options

4.2.1 ENERGY STAR requirements must be met under worst case testing in terms of all hardware and software configurations and under all potential MVPD networks/operating scenarios applicable to the model during operation. ENERGY STAR manufacturer/brand owner Partner must report the most consumptive results for the model. The reported value may exceed the tested value.

4.2.2 If a Partner wishes to certify configurations of a model for which non-ENERGY STAR certified alternative configurations or operating scenarios exist, the Partner must assign the certified configurations an identifier in the model name/number that is unique to ENERGY STAR certified configurations. This identifier must be used consistently in association with the certified configurations in marketing/sales materials and on the ENERGY STAR list of certified products (e.g. model A1234 for baseline configurations and A1234-ES for ENERGY STAR certified configurations).

Note: EPA considered aligning certification testing with that of the VA such that products must be tested on the MVPD network on which it would be used. However, EPA determined that doing so would penalize smaller providers and thus has maintained the above approach.
5 USER INTERFACE

5.1.1 Partners are encouraged to design products in accordance with the user interface standard IEEE P1621: Standard for User Interface Elements in Power Control of Electronic Devices Employed in Office/Consumer Environments. For details, see http://eetd.LBL.gov/Controls.

6 EFFECTIVE DATE

6.1.1 Effective Date: The Version 5.0 ENERGY STAR Set-top Box specification shall take effect on January XX, 2017. To qualify for ENERGY STAR, a product model shall meet the ENERGY STAR specification in effect on its date of manufacture. The date of manufacture is specific to each unit and is the date on which a unit is considered to be completely assembled.

6.1.2 Future Specification Revisions: EPA reserves the right to change this specification should technological and/or market changes affect its usefulness to consumers, industry, or the environment. In keeping with current policy, revisions to the specification are arrived at through stakeholder discussions. In the event of a specification revision, please note that the ENERGY STAR qualification is not automatically granted for the life of a product model.
