Following is the Draft 1 Version 6.0 product specification for ENERGY STAR certified central air conditioner and air source heat pump equipment. A product shall meet all of the identified criteria if it is to earn the ENERGY STAR.

1) Definitions: Below are the definitions of the relevant terms in this document.

A. Air-Source Heat Pump (ASHP): An air-source unitary heat pump model is a product other than a packaged terminal heat pump, which consists of one or more assemblies, powered by single phase electric current, rated below 65,000 Btu per hour, utilizing an indoor conditioning coil, compressor, and refrigerant-to-outdoor air heat exchanger to provide air heating, and may also provide air cooling, dehumidifying, humidifying circulating, and air cleaning.

B. Central Air Conditioner: A central air conditioner is a product which is powered by single phase electric current, air cooled, rated below 65,000 Btu per hour, not contained within the same cabinet as a furnace, the rated capacity of which is above 225,000 Btu per hour, and is a heat pump or a cooling unit only.

C. Single Package: A single package unit is an ASHP or central air conditioner that has all major assemblies enclosed in a single cabinet.

D. Split System: A split system is an ASHP or central air conditioner that has one or more of the major assemblies separated from the others.

E. Gas/Electric Package Unit: A single package unit with gas heating and electric air conditioning that is often installed on a slab or roof.

F. Basic Model: All units of a given type of covered product (or class thereof) manufactured by one manufacturer and which have the same primary energy source and, which have essentially identical electrical, physical, or functional (or hydraulic) characteristics that affect energy consumption, energy efficiency, water consumption or water efficiency.

G. Heating Seasonal Performance Factor (HSPF): HSPF is the total space heating required in region IV during the space heating season, expressed in Btu, divided by the total electrical energy consumed by the heat pump system during the same season, expressed in watt-hours.

H. Seasonal Energy Efficiency Ratio (SEER): SEER is the total heat removed from the conditioned space during the annual cooling season, expressed in Btu, divided by the total electrical energy consumed by the air conditioner or heat pump during the same season, expressed in watt-hours.

I. Energy Efficiency Ratio (EER): EER is the ratio of the average rate of space cooling delivered to the average rate of electrical energy consumed by the air conditioner or heat pump. This ratio is expressed in Btu per watt.h (Btu/W.h).

---

1 10 CFR part 430, Subpart A, § 430.2 Definitions
2 10 CFR part 430, Subpart B, Appendix M
3 Based on definition in 10 CFR part 430, Subpart B, Appendix M
J. Coefficient of Performance (COP)\(^1\): COP means the ratio of the average rate of space heating delivered to the average rate of electrical energy consumed by the heat pump. These rate quantities must be determined from a single test or, if derived via interpolation, must be determined at a single set of operating conditions. COP is a dimensionless quantity. When determined for a ducted coil-only system, COP must include the sections 3.7 and 3.9.1 of 10 CFR Part 430 Subpart B, Appendix M: Default values for the heat output and power input of a fan motor.

K. Percentage of Heating Capacity @ 5°F: The capacity of a given unit as measured under the conditions defined by Appendix M1 at 5°F, divided by the heating capacity as measured per Appendix M at 47°F, expressed as a percentage.

Note: EPA has included the definition of COP as defined in Appendix M to Subpart B of 10 CFR Part 430. EPA has also provided a definition of Percentage of Rated Capacity @ 5°F as required for Cold Climate ASHPs. Our understanding is that the most useful measure of 5F capacity is relative to the 47F capacity. However, this does entail a comparison between an Appendix M measurement and an Appendix M1 measurement. EPA welcomes feedback on this definition, and suggestions of alternatives that would demonstrate heating capacity at cold temperatures.

L. Independent Coil Manufacturer (ICM): A manufacturer that manufactures only the indoor unit (coil) in a Central Air Conditioner or Air-Source Heat Pump Split System.

M. System Manufacturer (SM): A manufacturer that manufactures all the major assemblies in an Air-Source Unitary Heat Pump and/or Unitary Air-Conditioner.

2) Scope:

A. Included Products: Single package, split system, and gas/electric package units that meet the definitions of an ASHP or central air conditioner as specified herein are eligible for ENERGY STAR certification, with the exception of products listed in Section 2.B. Units may be intended for installation into a duct system, or may be ductless.

B. Excluded Products: Three phase central air conditioners and ASHPs, and products rated at 65,000 Btu/h or above are not eligible for ENERGY STAR.

3) Certification Criteria:

A. Climates: ENERGY STAR requirements for ASHPs are divided into the following two climate applications.
   a. Cold Climate – Criteria designed for applications where performance should be optimized for peak heating and part-load cooling performance.
   b. Moderate and Hot Climate – Criteria designed for applications where performance should be optimized for peak cooling performance.

---

\(^1\) 10 CFR part 430 Subpart B, Appendix M

ENERGY STAR Program Requirements for ASHPs and Central Air-Conditioners – Eligibility Criteria
Note: EPA recognizes that there is an increasing market for heat pumps that perform well in colder climates and proposes a differentiated specification to recognize those units that are best suited to those installed locations. Under this proposal, EPA would identify those ASHPs meeting Cold Climate requirements with a modified ENERGY STAR certification mark designating those units as “ENERGY STAR Cold Climate.” All other qualifying ASHP units would comply with the SEER, EER, and HSPF requirements specified below for Moderate and Hot Climate (but not the additional COP requirement applied to Cold Climate products) and use an ENERGY STAR Moderate and Hot Climate designation. As with furnaces, it would be incumbent on brand owners to ensure that the correct designation is associated with each model or combination. The designations tailored for this purpose are intended to inform consumers of the suitability of an ASHP to their climate type without imposing strict requirements associated with installed or sold location. This has the advantage of providing better information for consumers in the many states with a moderate climate on average but with areas where a cold climate heat pump would perform better.

The climate differentiated approach outlined above is a modification of the approach EPA took for furnaces. We prefer the flexibility and simplicity it provides, but we could also use a state-specific regional approach that would be more like the Version 4.0 Furnace specification. In this case, regions are based on ≥ 5,000 HDD (population-weighted average by state), in accordance with the regions established by DOE in 76 CFR 37408. This type of regional label would include a shaded map to ensure that consumers are aware of the ENERGY STAR equipment that is most appropriate for their state, similar to the furnace US South certification mark below.

CACs would continue to use the standard ENERGY STAR label.

EPA would appreciate feedback regarding a climate-differentiated specification and label and welcomes feedback on these alternate approaches to it.

B. Energy Efficiency Requirements:

1. Including gas/electric package units.

C. Staged or Variable Capacity Requirement: To earn the ENERGY STAR, the unit must be capable of operating at two or more distinct capacities or must have a capacity which is continuously variable.

Note: In order to recognize ASHPs that best serve their installed location, EPA proposes climate specific requirements that reflect the efficiency needs of the climates defined previously in this specification. For Cold Climate ASHPs, EPA has increased the HSPF criteria and relaxed the EER criteria, as well as adding further requirements to characterize performance in colder temperatures.

To standardize recognition of cold climate performance across different energy efficiency specifications, EPA has based the COP @ 5 °F on the Northeast Energy Efficiency Partnerships (NEEP) cold climate Air Source Heat Pump (ccASHP) Specification Version 3.0. Cold climate heat pumps will also be required to provide a minimum of 80% of their 47°F heating capacity at the 5°F test condition to verify their suitability for use in cold climates. Stakeholders are requested to comment on the proposed differentiated specification and/or additional recognition for heat pumps appropriate for cold climates. EPA is also interested in whether the proposed levels require amendment, specifically in reference to regional suitability and market availability.

Staged and variable capacity CACs and ASHPs provide an opportunity to correct for oversizing and improve consumer comfort. EPA is proposing to require at least two stages of capacity for a unit to be recognized as ENERGY STAR.

Stakeholders are invited to comment on any issues or concerns they may have regarding the exclusion of single capacity units, particularly information about realistic situations where fixed capacity systems are a better choice. Stakeholders have shared that single capacity units would provide similar performance in some situations, if properly sized, at a lower cost. However, none have shared any detail about which situations, and without evidence that proper sizing is becoming more common. Additionally, EPA proposes a higher SEER level, in response to stakeholder discussions that indicate there are no dual capacity units on the market with SEER under 16. Given this, raising the SEER level allows the savings from greater seasonal efficiency to be reflected in the expected savings of ENERGY STAR certified products. EPA is interested to know whether the HSPF of dual capacity units is similarly higher.

D. Multiple Assemblies: For split system ASHP and central air conditioner, ENERGY STAR certification shall be determined by the rated performance of the particular combination of indoor and outdoor units as tested in accordance with the appropriate regional test procedure, regardless of the fact that the components may be used in other combinations.

E. Gas/Electric Package Units: To certify as ENERGY STAR, gas/electric package units shall meet the cooling portion of the single package specification requirements in Tables 2 and 3, above.
F. **ICM coil combinations:** To certify as ENERGY STAR, ICM coil combinations shall meet the Central Air Conditioner and Air-Source Heat Pump Split System specification requirements in Tables 2 and 3, above and include a condensing (outdoor) unit listed in the ENERGY STAR program by a system manufacturer.

G. The HSPF and SEER ratings for split systems shall be identical to the levels reported to DOE and appropriately reflected on the current Federal Trade Commission (FTC) Energy guide label. For packaged units, the HSPF and SEER ratings shall be identical to the levels reported on the Federal Trade Commission (FTC) Energy guide label and to those reported to DOE. For all units where EER is reported to DOE, the EER reported to EPA shall be identical.

H. **Significant Digits and Rounding:**
   a. All calculations shall be carried out with actual measured or observed values. Only the final result of a calculation shall be rounded. Unless otherwise directed below, calculated results shall be rounded to the nearest significant digit as expressed in the corresponding specification limit.
   b. Unless otherwise specified, compliance with specification limit shall be evaluated using exact values without any benefit from rounding.
   c. As specified in 10 CFR, 430.23(m)(3), SEER, and HSPF shall be rounded off to the nearest 0.05 Btu/W·h. Similarly, EER should also be rounded off to the nearest 0.05 Btu/W·h.
   d. As specified in 10 CFR part 430 Subpart B, Appendix M, capacity shall be expressed in accordance with in Table 4, below

<table>
<thead>
<tr>
<th>Capacity Ratings, Btu/h</th>
<th>Multiples, Btu/h</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 20,000</td>
<td>100</td>
</tr>
<tr>
<td>≥ 20,000 and &lt; 38,000</td>
<td>200</td>
</tr>
<tr>
<td>≥ 38,000 and &lt; 65,000</td>
<td>500</td>
</tr>
</tbody>
</table>

4) **Connected Product Criteria:**

Note: Language for Connected Product Criteria is currently under development and stakeholders should expect Draft 2 of this specification to include optional connected criteria. EPA’s proposed connected criteria will be strongly informed by the recently-released AHRI 1380 technical standard. In addition, we will consider comments received on the Connected Criteria for Large Load Products Discussion Guide.

5) **Test Requirements:**

A. One of the following sampling plans shall be used for purposes of testing for ENERGY STAR certification:
   a. A single unit is selected, obtained, and tested. The measured performance of this unit and of each subsequent unit manufactured must be equal to or better than the ENERGY STAR specification requirements. Results of the tested unit may be used to certify additional individual model variations within a Basic Model as long as the definition for Basic Model provided in Section 1, above, is met; or
   b. Ratings are determined pursuant to the sampling requirements defined in 10 CFR Part 429, Subpart B § 429.16 either by selecting units for testing or by the application of an alternative rating method (ARM) as defined in 10 CFR Part 429.70. The certified rating must be equal to or better than the ENERGY STAR specification requirements. Results of the tested or simulated unit may be used to certify additional model variations within a Basic Model as long as the definition for provided above and in 10 CFR Part 430.2 is met. Further, all individual models within a Basic Model must have the same certified rating per DOE’s regulations in Part 429 and this rating must be used for all manufacturer literature,
the certified product list, and certification of compliance to DOE energy conservation standards.

c. For heat pumps to achieve the ENERGY STAR with the Cold Climate regional label, the testing must include the H4 very low temperature condition as defined in 10 CFR part 430 Subpart B, Appendix M1, Table 11 through Table 15 as applicable. This test condition shall be used to determine COP and Percentage of Rated Capacity at 5° F as required by Table 3 in this specification. Heat pumps looking to achieve the ENERGY STAR with the Cold Climate regional label must follow 10 CFR part 430 Subpart B, Appendix M to determine SEER, EER, and HSPF.

B. When testing ASHPs and central air conditioners, the following test method shall be used to determine ENERGY STAR certification:

<table>
<thead>
<tr>
<th>ENERGY STAR Requirement</th>
<th>Region</th>
<th>Test Method Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEER, EER, HSPF</td>
<td>Cold Climate and Moderate and Hot Climate</td>
<td>10 CFR part 430 Subpart B, Appendix M</td>
</tr>
<tr>
<td>COP @ 5° F, Percentage of Heating Capacity @ 5°F</td>
<td>Cold Climate</td>
<td>10 CFR part 430 Subpart B Appendix M1 for H4 very low temperature Heating Test condition only</td>
</tr>
</tbody>
</table>

Note: As stated above, EPA seeks to validate cold climate performance with consistent test data without imposing undue burden on our partners. The testing procedure described in Appendix M1 is intended to allow for structure and consistency to be added to the 5° F reported data, without requiring full compliance with Appendix M1 prior to its effective date. Stakeholders are invited to provide feedback on the feasibility of implementing this additional test point and any concerns about compliance with the test method. EPA is aware of potential impacts of the static pressure specified in the Appendix M1 procedure on measured COP and is specifically interested in receiving feedback or data regarding such impacts.

6) Effective Date: This ENERGY STAR ASHP and Central Air-Conditioners Specification shall take effect on TBD. To certify for ENERGY STAR, a product model shall meet the ENERGY STAR specification in effect on the date of manufacture. The date of manufacture is specific to each unit and is the date (e.g., month and year) on which a unit is considered to be completely assembled.

Note: EPA aims to finalize the Version 6.0 CAC/ASHP specification by the end of 2019, with an effective date in Q3 or Q4 of 2020.

7) Future Specification Revisions: EPA reserves the right to change the specification should technological and/or market changes affect its usefulness to consumers, industry, or the environment. In keeping with current policy, revisions to the specification are arrived at through industry discussions. In the event of a specification revision, please note that the ENERGY STAR certification is not automatically granted for the life of a product model.
