Following are the terms of the ENERGY STAR Partnership Agreement as it pertains to the manufacture and labeling of ENERGY STAR qualified products. The ENERGY STAR Partner must adhere to the following partner commitments:

Qualifying Products

1. **Comply with current ENERGY STAR Eligibility Criteria**, which define performance requirements and test procedures for Audio/Video equipment. A list of eligible products and their corresponding Eligibility Criteria can be found at www.energystar.gov/specifications.

2. **Prior to associating the ENERGY STAR name or mark with any product**, obtain written certification of ENERGY STAR qualification from a Certification Body recognized by EPA for Audio/Video equipment. As part of this certification process, products must be tested in a laboratory recognized by EPA to perform Audio/Video equipment testing. A list of EPA-recognized laboratories and certification bodies can be found at www.energystar.gov/testingandverification.

3. **Ensure that any model associated with the ENERGY STAR name or mark** meets the following standards:

   Product material requirements as defined in restriction of hazardous substances (RoHS) regulations, as generally accepted. This includes exemptions in force at the date of product manufacture, where the maximum concentration values tolerated by weight in homogeneous materials are: lead (0.1%), mercury (0.1%), cadmium (0.01%), hexavalent chromium (0.1%), polybrominated biphenyls (PBB) (0.1%), or polybrominated diphenyl ethers (PBDE) (0.1%). Batteries are exempt.

   **Notes:**
   - The explicit intention is to harmonize with EU RoHS.
   - For purposes of ENERGY STAR third-party certification, these requirements shall not be reviewed when products are initially qualified nor during subsequent verification testing. Rather, EPA reserves the right to request supporting documentation at any time.

Using the ENERGY STAR Name and Marks

4. Comply with current ENERGY STAR Identity Guidelines, which define how the ENERGY STAR name and marks may be used. Partner is responsible for adhering to these guidelines and ensuring that its authorized representatives, such as advertising agencies, dealers, and distributors, are also in compliance. The ENERGY STAR Identity Guidelines are available at www.energystar.gov/logouse.

5. Use the ENERGY STAR name and marks only in association with qualified products. Partner may not refer to itself as an ENERGY STAR Partner unless at least one product is qualified and offered for sale in the U.S and/or ENERGY STAR partner countries.

6. Provide clear and consistent labeling of ENERGY STAR qualified Audio/Video equipment.

   6.1. Partner must use the ENERGY STAR mark in all of the following ways:

   6.1.1. Via permanent or temporary label on the product. All temporary labeling must be affixed to the top/front of the product with an adhesive or cling-type application. Partner must comply with guidance for certification marks provided in the ENERGY STAR Identity Guidelines, which can be found at www.energystar.gov/marks;
6.1.2. Either in product literature (e.g., user manuals, specification sheets, etc.) or in a separate box insert that provides educational language about the Product’s ENERGY STAR settings; and

6.1.3. On product packaging/boxes for products sold at retail.

6.2. If additional information about the ENERGY STAR program(s) or other products is provided by the Partner on its Web site, Partner must comply with the ENERGY STAR Web Linking Policy, which can be found at www.energystar.gov/partners.

Verifying Ongoing Product Qualification

7. Participate in third-party verification testing through a Certification Body recognized by EPA for Audio/Video equipment, providing full cooperation and timely responses. EPA/DOE may also, at its discretion, conduct tests on products that are referred to as ENERGY STAR qualified. These products may be obtained on the open market, or voluntarily supplied by Partner at the government’s request.

Providing Information to EPA

8. Provide unit shipment data or other market indicators to EPA annually to assist with creation of ENERGY STAR market penetration estimates, as follows:

8.1. Partner must submit the total number of ENERGY STAR qualified Audio/Video equipment shipped in the calendar year or an equivalent measurement as agreed to in advance by EPA and Partner. Partner shall exclude shipments to organizations that rebrand and resell the shipments (unaffiliated private labelers).

8.2. Partner must provide unit shipment data segmented by meaningful product characteristics (e.g., type, capacity, presence of additional functions) as prescribed by EPA.

8.3. Partner must submit unit shipment data for each calendar year to EPA or an EPA-authorized third party, preferably in electronic format, no later than March 1 of the following year. Submitted unit shipment data will be used by EPA only for program evaluation purposes and will be closely controlled. If requested under the Freedom of Information Act (FOIA), EPA will argue that the data is exempt. Any information used will be masked by EPA so as to protect the confidentiality of the Partner.

9. Report to EPA any attempts by recognized laboratories or Certification Bodies (CBs) to influence testing or certification results or to engage in discriminatory practices.

10. Notify EPA of a change in the designated responsible party or contacts within 30 days using the My ENERGY STAR Account tool (MESA) available at www.energystar.gov/mesa.

Performance for Special Distinction

In order to receive additional recognition and/or support from EPA for its efforts within the Partnership, the ENERGY STAR Partner may consider the following voluntary measures, and should keep EPA informed on the progress of these efforts:

- Provide quarterly, written updates to EPA as to the efforts undertaken by Partner to increase availability of ENERGY STAR qualified products, and to promote awareness of ENERGY STAR and its message.
- Consider energy efficiency improvements in company facilities and pursue benchmarking buildings through the ENERGY STAR Buildings program.
- Purchase ENERGY STAR qualified products. Revise the company purchasing or procurement specifications to include ENERGY STAR. Provide procurement officials’ contact information to EPA for
periodic updates and coordination. Circulate general ENERGY STAR qualified product information to employees for use when purchasing products for their homes.

- Feature the ENERGY STAR mark(s) on Partner website and other promotional materials. If information concerning ENERGY STAR is provided on the Partner website as specified by the ENERGY STAR Web Linking Policy (available in the Partner Resources section of the ENERGY STAR website), EPA may provide links where appropriate to the Partner website.

- Ensure the power management feature is enabled on all ENERGY STAR qualified displays and computers in use in company facilities, particularly upon installation and after service is performed.

- Provide general information about the ENERGY STAR program to employees whose jobs are relevant to the development, marketing, sales, and service of current ENERGY STAR qualified products.

- Provide a simple plan to EPA outlining specific measures Partner plans to undertake beyond the program requirements listed above. By doing so, EPA may be able to coordinate, and communicate Partner’s activities, provide an EPA representative, or include news about the event in the ENERGY STAR newsletter, on the ENERGY STAR website, etc. The plan may be as simple as providing a list of planned activities or milestones of which Partner would like EPA to be aware. For example, activities may include: (1) increasing the availability of ENERGY STAR qualified products by converting the entire product line within two years to meet ENERGY STAR guidelines; (2) demonstrating the economic and environmental benefits of energy efficiency through special in-store displays twice a year; (3) providing information to users (via the website and user’s manual) about energy-saving features and operating characteristics of ENERGY STAR qualified products; and (4) building awareness of the ENERGY STAR Partnership and brand identity by collaborating with EPA on one print advertorial and one live press event.

- Join EPA's SmartWay Transport Partnership to improve the environmental performance of the company's shipping operations. The SmartWay Transport Partnership works with freight carriers, shippers, and other stakeholders in the goods movement industry to reduce fuel consumption, greenhouse gases, and air pollution. For more information on SmartWay, visit [www.epa.gov/smartway](http://www.epa.gov/smartway).

- Join EPA’s Green Power Partnership. EPA’s Green Power Partnership encourages organizations to buy green power as a way to reduce the environmental impacts associated with traditional fossil fuel-based electricity use. The partnership includes a diverse set of organizations including Fortune 500 companies, small and medium businesses, government institutions as well as a growing number of colleges and universities. For more information on Green Power, visit [www.epa.gov/greenpower](http://www.epa.gov/greenpower).
Following is the Version 3.0 product specification for ENERGY STAR qualified Audio/Video products. A product shall meet all of the identified criteria if it is to earn the ENERGY STAR.

1 DEFINITIONS

A) Audio/Video (AV) Product: A mains-connected product that offers Audio Amplification and/or Optical Disc Player functions.

B) Auto Power Down (APD): The capability to automatically switch a device from On Mode to Sleep Mode after a predetermined period of time (APD timing) has elapsed. APD timing begins when both:
   1) The device has ceased performance of all Primary Functions, and
   2) The last user input has been received (e.g., remote control signal, volume adjustment).

If either a Primary Function resumes or a user input is received, the APD timing will reset. The intent of APD is that products will automatically power down into Sleep Mode when they are not being adjusted by the user and are not performing a Primary Function.

Example 1: A DVD player is by definition performing a Primary Function during active video playback from the disc; and thus is not required to APD for the duration of active video playback. The same DVD player is expected to power down to Sleep Mode within the APD time setting when video content playback concludes, such that the product does not indefinitely remain in On Mode while in a disc menu screen.

Example 2: An amplifier that is playing music is performing a Primary Function and thus is not required to APD. Once the music has stopped playing, and the user is not interacting with the product, the product will be expected to power down.

C) Loss of Signal (LOS):
   1) For audio signals, LOS is defined as:
      a) Analog Inputs: Signal dropping below that required for MUP by a factor of not less than 30dB and not more than 70dB. For products without audio amplification, Signal less than 1dB above the measured noise floor for 60 seconds.
      b) HDMI: Receive <Inactive Source> or <Standby> signal over the CEC channel, or [Power Status] of an upstream device goes to “Standby” or “In Transition to Standby” over the CEC channel;
      c) Other Digital Inputs (e.g., Ethernet): No audio information in the data stream; or
      d) Detectable cable disconnects.
   2) For video signals, LOS is defined as:
      a) Analog Inputs: Loss of either the horizontal or vertical sync signal
b) HDMI: Receive <Inactive Source> or <Standby> signal over the Consumer Electronics Control (CEC) channel, or [Power Status] of an upstream device goes to “Standby” or “In Transition to Standby” over the CEC channel; or detection of a disabled TMDS link, a TMDS clock line signal below 22.5 MHz for more than one second, or a TMDS link operating outside of the valid frequency range;

c) DVI: Detection of a disabled TMDS link, a TMDS clock line signal below 22.5 MHz for more than one second, or a TMDS link operating outside of the valid frequency range;

d) Other Digital Inputs (e.g., Ethernet): No video information in the data stream; or
e) Detectable cable disconnects.

D) Primary Function: Any discrete, dynamic device function that can be perceived by an end user, including the delivery or processing of audio/video content, and excluding the following:

1) Continuous device functions (e.g., clocks, Status Displays, indicator lamps),

2) Static device functions, such as:
   a) No active audio or video processing or output;
   b) Playback paused or stopped;
   c) No optical disc media in disc drive; or
   d) Waiting in disc menu or other menu for user input.

E) Operational Modes:

1) On Mode: Where the product is connected to a mains power source, has been activated and is capable of providing one or more Primary Functions. The common terms “active”, “in-use” and “normal operation” also describe this mode.
   a) Active State: A state within On Mode in which a product is performing a Primary Function.
   b) Idle State: A state within On Mode in which a product is not performing a Primary Function and no content is actively being delivered to the end-user.

2) Sleep Mode: Where the product is connected to a mains power source, is incapable of providing a Primary Function, and offers one or more of the following user oriented or protective functions which may persist for an indefinite time. The common term “standby” may also describe this mode.
   a) To facilitate the activation of other modes (including activation of On Mode) by remote switch (including remote control), internal sensor, or timer;
   b) Continuous function: information or Status Displays including clocks;
   c) Continuous function: sensor-based functions.

   For purposes of this specification, Sleep Mode is defined as the condition where the product is connected to a power source, produces neither sound nor picture, neither transmits nor receives program information and/or data (excluding data transmitted to change the unit’s condition from Sleep Mode to On Mode), and is waiting to be switched to On Mode by a direct or indirect signal from the consumer (e.g., with the remote control).

3) Off Mode: Where the product is connected to a mains power source, is not providing any On Mode or Sleep Mode functions, and cannot be switched into any other mode except by user actuation of a manual power switch. An indicator that only shows the user that the product is in the off position is included within the classification of an Off Mode.

F) External Power Supply (EPS): Also referred to as External Power Adapter. A component contained in a separate physical enclosure external to the AV Product, designed to convert line voltage AC input from the mains to lower dc voltage(s) in order to provide power to the AV Product. An EPS connects to the AV Product via a removable or hard-wired male/female electrical connection, cable, cord or other wiring.
G) **High-Definition Multimedia Interface (HDMI):** A compact audio/video interface for transmitting uncompressed digital data.
   1) **Consumer Electronics Control (CEC) Protocol:** A single-conductor wire or bus technology that is an optional feature in the HDMI specification. CEC is meant to carry IR/remote and/or control commands between interconnected HDMI devices.

H) **High Definition Resolution (HD):** Video output with resolution greater than 480 lines (480 i/p).

I) **Standard Definition Resolution (SD):** Video output with resolution less than or equal to 480 lines (480 i/p).

J) **Multi-component System:** A product consisting of several components with separate enclosures that are sold as and intended for use as a single system. A “Home Theater in a Box” is an example of a Multi-component System.

K) **Audio Amplifier Type Classifications:**
   1) **Full-spectrum Audio Amplifier:** An amplifier capable of full audible frequency range (20 Hz to 20 kHz) output on all channels.
   2) **Limited-bandwidth Audio Amplifier:** An amplifier limited to less than full audible frequency range (20 Hz to 20 kHz) output on one or more channels.

L) **Audio Amplifier Use Classifications:**
   1) **Consumer Amplifier:** An amplifier product that possesses 4 of the following 5 characteristics:
      a) Digital inputs use a S/PDIF, HDMI, or portable music player dock connector(s), or a standard wireless technology (e.g., a Bluetooth receiver supporting A2DP);
      b) Analog inputs utilize RCA connections, TRS connections (1/4” or 1/8”), and/or spring clip style connectors;
      c) Analog inputs have -5 dBV input sensitivity to achieve full output power when using a 1kHz sine wave input;
      d) AC plug has two conductors and no grounding connection and is limited to 15 amperes ac current (e.g., NEMA 1);
      e) An IR or RF remote control is included with or can control the product.
   2) **Commercial Amplifier:** All amplifier products that do not meet the defining criteria for a Consumer Amplifier will be considered a Commercial Amplifier.

M) **Product Functions:**
   1) **Audio Amplification:** A function by which a device increases the amplitude of an audio signal for purposes of sending the signal to a transducer for playback.
   2) **Audio Signal Processing:** A function by which a device modifies an audio signal for a purpose other than amplification.
   3) **High Resolution Display:** A function by which a device converts a video signal into a visual output (e.g., LCD panel, plasma display panel). This definition does not include Status Displays.
   4) **Status Display:** A function by which a product provides a visual display of less than 480x234 pixel resolution or 5 inches diagonal screen size, including a back-lit alphanumeric clock or channel indicator. This definition does not include single indicator lamps.
   5) **IP Video Tuner:** A function by which a device can play back streaming digital video content packetized or downloaded over an IP network.

1 Note that single indicator lamps are not provided power allowances under this specification.
6) Networking / Control Protocol: A function by which a device can connect to a network for transmission and receipt of data. The connection may be wired or wireless (e.g., IR communications, Ethernet, Bluetooth, RS-232, USB).

7) Wi-Fi and Gigabit Ethernet Protocols: Networking connections that have been defined to require additional power for transmission and receipt of data in Audio/Video products. Connections are limited to Gigabit Ethernet and Wi-Fi.

8) Optical Disc Player / Recorder: A function by which a device can read and/or write data to removable disk media (e.g., CD, DVD, Blu-ray Disc).

N) Total Harmonic Distortion (THD): The ratio of the sum of the powers of all harmonic components to the power of the fundamental frequency of a signal.

O) Maximum Undistorted Power (MUP): The amplifier output power at which the THD of any output channel is 1.0% or greater for a given input.

P) Product Family: A group of product models that are (1) made by the same manufacturer, (2) subject to the same ENERGY STAR qualification criteria, and (3) of a common basic design. Product models within a family differ from each other according to one or more characteristics or features that either (1) have no impact on product performance with regard to ENERGY STAR qualification criteria, or (2) are specified herein as acceptable variations within a Product Family. For Audio/Video, acceptable variations within a Product Family include:
   1) Color, and
   2) Housing.

2 SCOPE

2.1 Included Products

2.1.1 Products that meet the definition of an AV Product as specified herein are eligible for ENERGY STAR qualification, with the exception of products listed in Section 2.2.

2.2 Excluded Products

2.2.1 Products that are covered under other ENERGY STAR product specifications are not eligible for qualification under this specification. The list of specifications currently in effect can be found at www.energystar.gov/specifications.

2.2.2 The following products are excluded from qualification under this specification.
   i. Products whose primary video playback capability is via IP Video Tuner and which are sold or provided outside of a dedicated service contract,
   ii. Primarily battery-powered products (e.g., MP3 players, portable DVD players, portable gaming systems),
   iii. Products for use in automotive applications,
   iv. Video projectors,
   v. Home and building automation and control products,
   vi. Whole-house and whole-building audio and/or video systems,
   vii. Videoconferencing systems,
   viii. Wireless microphone systems,
   ix. A/B selector switches, and
   x. Media servers.
3 QUALIFICATION CRITERIA

3.1 Significant Digits and Rounding
3.1.1 All calculations shall be carried out with directly measured (unrounded) values.
3.1.2 Unless otherwise specified, compliance with specification limits shall be evaluated using directly measured or calculated values without any benefit from rounding.
3.1.3 Directly measured or calculated values that are submitted for reporting on the ENERGY STAR website shall be rounded to the nearest significant digit as expressed in the corresponding specification limit.

3.2 General Qualification Criteria
3.2.1 External Power Supplies (EPSs): Single- and Multiple-voltage EPSs shall meet the Level V or higher performance requirements under the International Efficiency Marking Protocol when tested according to the Uniform Test Method for Measuring the Energy Consumption of External Power Supplies, Appendix Z to 10 CFR Part 430.
   i. Single-voltage EPSs shall include the Level V or higher marking.
   ii. Multiple-voltage EPSs meeting Level VI or higher shall include the Level VI or higher marking.
   iii. Additional information on the Marking Protocol is available at http://www.regulations.gov/#/documentDetail;D=EERE-2008-BT-STD-0005-0218
3.2.2 Multi-component Systems: Each power-consuming component in a Multi-component System shall be assessed independently. To qualify for ENERGY STAR, each component shall meet applicable ENERGY STAR criteria.
3.2.3 Networking / Control Protocols: To qualify for ENERGY STAR, AV Products that offer one or more Networking / Control Protocol options shall meet all applicable ENERGY STAR criteria in all possible control protocol configurations.
3.2.4 Networking / Control Protocol Allowances: The following guidance shall be used for allowances provided for Sleep Mode, Idle State and On Mode Power requirement calculation. This guidance applies to Networking / Control Protocols and Wi-Fi and Gigabit Ethernet Protocols as defined in Section 1.
   a) Each different and distinct in-use and active protocol will receive an allowance.
   b) In the case that multiple instances of the same protocol are implemented in a single product, a single allowance will be awarded for the first instance. In addition, a single allowance will be awarded for each subsequent set of five (or fewer if less than a multiple of 5+1 exist) in-use and active networking/control protocols.

Example 1: A product that implements both RS-232 and Bluetooth would receive two allowances, one for each protocol.

Example 2: A product that implements 10 iterations of RS-232 would receive three allowances (one for the first iteration, one for the next set of five, and one for the remaining four.

3.3 Auto Power Down (APD) Requirements
3.3.1 APD functionality shall be available on all products except those that are subject to third-party performance standards that prohibit APD, including those used for Mass Notification and Emergency Communications Systems and those subject to ANSI/UL 2572.
3.3.2 APD functionality shall be enabled by default, with APD timing less than or equal to 2 hours, subject to the following exceptions:
i. Products may offer users the option (e.g., via system menu or physical switch) to modify APD timing in 10 minute intervals, or to disable APD entirely.

ii. Products may initiate APD immediately upon receipt of authoritative control instruction via an active Networking / Control Protocol.

iii. Commercial Amplifiers as defined in Section 1 may be shipped with APD disabled. If APD is disabled, the product shall meet the Idle State power requirements.

### 3.3.3 APD Timing Default Settings shall be as follows:

i. **APD Timing ≤ 30 minutes:** This timing option is acceptable for use as a default setting. If APD timing is set by default to no more than 30 minutes and APD cannot be disabled or increased to greater than 30 minutes, products do not have to meet Idle State power requirements.

ii. **30 minutes < APD Timing ≤ 2 hours:** This timing option is acceptable for use as a default setting. If APD can be disabled, or if APD timing can be set to greater than 30 minutes, products shall meet Idle State power requirements.

iii. **APD Timing > 2 hours:** This timing option may only be enabled by the end user and is not available for use as a default setting. If APD can be disabled, or if APD timing can be set to greater than 30 minutes, products shall meet Idle State power requirements.

### 3.4 Sleep Mode Requirements

#### 3.4.1 Measured Sleep Mode power \( (P_{SLEEP}) \) shall be less than or equal to the Maximum Sleep Mode Power Requirement \( (P_{SLEEP\_MAX}) \), as calculated per Equation 1.

i. If a product’s Idle State meets the Sleep Mode power requirements, a distinct and separate Sleep Mode is not required to be implemented.

#### Equation 1: Calculation of Maximum Sleep Mode Power Requirement

\[
P_{SLEEP\_MAX} = P_{SLEEP\_BASE} + \sum_{i=1}^{n} P_{WAKE\_i}
\]

*Where:*

- \( P_{SLEEP\_MAX} \) is the Maximum Sleep Mode Power Requirement;
- \( P_{SLEEP\_BASE} \) is the base Sleep Mode power allowance for all products, as specified in Table 1;
- \( P_{WAKE\_i} \) is the Sleep Mode power allowance for each active, in-use networking/control protocol that provides remote hosts with the capability to wake the product from Sleep Mode, as specified in Table 1, for a total of \( n \) such allowances.

#### Table 1: Sleep Mode Power Allowances

<table>
<thead>
<tr>
<th>Product Function</th>
<th>Sleep Mode Power Allowance (watts)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base Allowance for All Products ( (P_{SLEEP_BASE}) )</td>
<td>1.0</td>
</tr>
<tr>
<td>In-use Networking / Control Protocol with Wake Capability ( (P_{WAKE_i}) )</td>
<td>1.0</td>
</tr>
<tr>
<td>In-use Wi-Fi or Gigabit Ethernet Protocols with Wake Capability ( (P_{WAKE_i}) ) (Applied to Either Wi-Fi or Gigabit Ethernet, but Not Both Simultaneously)</td>
<td>2.0</td>
</tr>
</tbody>
</table>
3.5 Optical Disc Player On Mode Requirements

3.5.1 Measured On Mode power (P_{ON}) for products with Optical Disc Players, shall be less than or equal to the Maximum On Mode Power requirement (P_{ON_MAX}), as calculated per Equation 2, subject to the following requirements:

i. Measured On Mode power for Optical Disc Players capable of processing both SD and HD video content shall be the average of the On Mode power when processing SD content and the On Mode power when processing HD content, as measured per the test procedure.

ii. On Mode power allowances specified in Table 2 shall be applied only once per product. The highest applicable allowance may be used.

iii. The Networking / Control Protocol On Mode power allowance shall be applied only to active, in-use Networking / Control Protocols.

Equation 2: Calculation of Maximum On Mode Power Requirement

\[ P_{ON\_MAX} = P_{ON} + \sum_{i=1}^{n} P_{ADD,i} \]

Where:

- \( P_{ON\_MAX} \) is the Maximum On Mode Power Requirement, in watts;
- \( P_{ON} \) is the On Mode power base allowance for each applicable product function listed in Table 2. Note: only one \( P_{ON} \) shall be applied per product; and
- \( P_{ADD,i} \) is the On Mode Power Function Adder for each applicable product function listed in Table 3, rounded to the nearest 0.1 watts, for a total of \( n \) such allowances.

Table 2: On Mode Power Base Allowances

<table>
<thead>
<tr>
<th>Product Function</th>
<th>On Mode Power Allowance, ( P_{ON} ) (watts)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SD or Audio Source Optical Disc Player: Playback Test</td>
<td>6.0</td>
</tr>
<tr>
<td>SD Source to HD Output “Upconversion” Optical Disk Player: Playback Test</td>
<td>10.0</td>
</tr>
<tr>
<td>HD Source Optical Disc Player: Playback Test</td>
<td>10.5</td>
</tr>
</tbody>
</table>
Table 3: On Mode Power Function Allowances

<table>
<thead>
<tr>
<th>Product Function</th>
<th>On Mode Power Allowance, $P_{ADD,i}$ (watts, rounded to the nearest 0.1 W for reporting)</th>
</tr>
</thead>
<tbody>
<tr>
<td>High Resolution Display</td>
<td>$P_{ON} = (6 \times R) + (0.05 \times A) + 3.0$</td>
</tr>
<tr>
<td></td>
<td>Where: $R$ is the display resolution $(x \times y)$ in megapixels</td>
</tr>
<tr>
<td></td>
<td>$A$ is the viewable screen area in square inches</td>
</tr>
<tr>
<td>In-use Networking / Control Protocol</td>
<td>1.0</td>
</tr>
<tr>
<td>In-use Wi-Fi or Gigabit Ethernet Protocols</td>
<td>2.0</td>
</tr>
<tr>
<td>(Applied to Either Wi-Fi or Gigabit Ethernet,</td>
<td>but Not Both Simultaneously)</td>
</tr>
<tr>
<td>Audio Amplification</td>
<td>$P_{OUT} \leq 50$</td>
</tr>
<tr>
<td>Where: $P_{OUT}$ is the output power at $1/8$</td>
<td>5.0</td>
</tr>
<tr>
<td>MUP with $1$kHz sinusoidal input</td>
<td>$P_{OUT} &gt; 50$</td>
</tr>
<tr>
<td></td>
<td>$(0.1 \times P_{OUT})$</td>
</tr>
</tbody>
</table>

Example: The Maximum On Mode power requirement for an AV Product with an integrated display, HD Blu-ray Disc player, and an active Ethernet network connection would be calculated as follows:

1. The HD Optical Disc Player would receive 10.5 watts during playback;

2. A display with 480 x 234 pixel resolution (0.112320 MP) and a 7 inch diagonal screen (viewable area of 20.9 square inches), would receive $(6 \times 0.112320) + (0.05 \times 20.9) + 3.0 = 4.7$ watts; and

3. The Ethernet connection would receive 1.0 watts. The On Mode power limit during playback of video content from the disc would be $10.5 \text{ W} + 4.7 \text{ W} + 1.0 \text{ W} = 16.2 \text{ watts}$.

3.6 Idle State Requirements

3.6.1 Measured Idle State power ($P_{IDLE}$), shall be less than or equal to the Maximum Idle State Power requirement ($P_{IDLE\_MAX}$), as calculated per Equation 3, subject to the following requirements:

i. Products with a default APD timing less than or equal to 30 minutes and that cannot be disabled or increased to greater than 30 minutes shall be excluded from the requirement.

Equation 3: Calculation of Maximum Idle State Power Requirement

$$P_{IDLE\_MAX} = \sum_{i=1}^{n} P_{IDLE\_i}$$

Where:

- $P_{IDLE\_MAX}$ is the Maximum Idle State Power Requirement, in watts; and
- $P_{IDLE\_i}$ is the Idle State power allowance for each applicable product function listed in Table 4, for a total of $n$ such allowances.
### Table 4: Idle State Power Allowances

<table>
<thead>
<tr>
<th>Product Function</th>
<th>Idle State Power Allowance, $P_{IDLE,i}$ (watts, rounded to the nearest 0.1 W for reporting)</th>

<td>In-use Wi-Fi or Gigabit Ethernet Protocols (Applied to Either Wi-Fi or Gigabit Ethernet, but Not Both Simultaneously)</td>
<td>2.0</td>
</tr>
<tr>
<td>Audio Amplification</td>
<td>$P_{OUT} \leq 50$ watts</td>
</tr>
<tr>
<td>Where: $P_{OUT}$ is the output power at 1/8 MUP with 1kHz sinusoidal input</td>
<td>$P_{IDLE}$</td>
</tr>
<tr>
<td>$P_{OUT} &gt; 50$</td>
<td>$(0.1 \times P_{OUT})$</td>
</tr>
</tbody>
</table>

### 3.7 Amplifier Efficiency Requirements

3.7.1 Measured amplifier efficiency ($\eta$) of products that offer Audio Amplification, as calculated per Equation 4, shall be greater than or equal to the On Mode amplifier efficiency requirements specified in Table 5.

i. If no AV inputs are available and the Optical Disc Player is used for audio signal input (per ENERGY STAR test method Section 5.E), the power consumption of the Optical Disc Player, $P_{DISC}$, as measured in Section 8.2 of the test procedure, may be subtracted from the total measured power consumption of the device for the audio amplifier efficiency calculation.

ii. If the amplifier is tested with an AV input, then $P_{DISC} = 0$ and $P_{IDLE} = 0$.

**Equation 4: Calculation of Amplifier Efficiency**

$$\eta = \frac{P_{OUT}}{P_{IN} - P_{DISC} + P_{IDLE}}$$

Where:

- $\eta$ is the amplifier efficiency;
- $P_{OUT}$ is the output power at 1/8 MUP with 1 kHz sinusoidal input, in watts;
- $P_{IN}$ is the input power at 1/8 MUP with 1 kHz sinusoidal input, in watts;
- $P_{DISC}$ is the power consumption from the Optical Disc Player, as measured in Section 8.2 of the test procedure, for products without AV inputs only; otherwise it shall be 0; and
- $P_{IDLE}$ is the power in Idle Mode, as measured in Section 7.2 of the test procedure, for products without AV inputs only; otherwise it shall be 0.

### Table 5: Amplifier Efficiency Requirements

<table>
<thead>
<tr>
<th>Amplifier Input Power at 1/8 MUP with 1 kHz Sinusoidal Input, $P_{IN}$ (W)</th>
<th>Version 3.0 Minimum Amplifier Efficiency, $\eta$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$P_{IN} &lt; 20$</td>
<td>N/A</td>
</tr>

4 TESTING

4.1 Test Methods

When testing Audio/Video products, the test methods identified in Table 6 shall be used to determine ENERGY STAR qualification.

Table 6. Test Methods for ENERGY STAR Qualification

<table>
<thead>
<tr>
<th>Product Type</th>
<th>Test Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>ENERGY STAR Test Method for Audio/Video, Rev. July-2012</td>
</tr>
</tbody>
</table>

4.2 Number of Units Required for Testing

Representative Models shall be selected for testing per the following requirements:

i. For qualification of an individual product model, a product configuration equivalent to that which is intended to be marketed and labeled as ENERGY STAR is considered the Representative Model;

ii. For qualification of a Product Family, any product configuration within the family may be considered the Representative Model.

4.2.2 A single unit of each Representative Model shall be selected for testing.

4.3 International Market Qualification

Products shall be tested for qualification at the relevant input voltage/frequency combination for each market in which they will be sold and promoted as ENERGY STAR.

5 USER INTERFACE

5.1.1 Partners are encouraged to design products in accordance with the user interface standard IEEE P1621: Standard for User Interface Elements in Power Control of Electronic Devices Employed in Office/Consumer Environments. For details, see http://eetd.lbl.gov/Controls.

6 EFFECTIVE DATE

6.1.1 Effective Date: The Version 3.0 ENERGY STAR Audio/Video specification shall take effect on May 1, 2013.

6.1.2 To qualify for ENERGY STAR, a product model shall meet the ENERGY STAR specification in effect on its date of manufacture. The date of manufacture is specific to each unit and is the date (e.g., month and year) on which a unit is considered to be completely assembled.
6.1.3 **Future Specification Revisions**: EPA reserves the right to change this specification should technological and/or market changes affect its usefulness to consumers, industry, or the environment. In keeping with current policy, revisions to the specification are arrived at through stakeholder discussions. In the event of a specification revision, please note that the ENERGY STAR qualification is not automatically granted for the life of a product model.
1 OVERVIEW
The following test method shall be used for determining product compliance with requirements in the ENERGY STAR Eligibility Criteria for Audio/Video.

2 APPLICABILITY
ENERGY STAR test requirements are dependent upon the feature set of the product under evaluation. The following guidelines shall be used to determine the applicability of each section of this document:

- Power mode tests (Section 7) shall be performed on every product;
- Optical disc player tests (Section 8) shall be performed on any product capable of playback of audio and/or video stored on optical media (e.g., CD, SA-CD, DVD, Blu-ray Disc); and
- Audio amplification tests (Section 9) shall be performed on any product that offers Audio Amplification.
- Tests of the auto-power down (APD) function (Section 7.1) shall be performed on all products except those subject to 3rd-party performance standards that prohibit APD.

Example: A typical Home Theater in a Box (HTIB) system with an integrated DVD player/recorder and audio amplifiers would be subject to the power mode tests in Section 7, several of the optical disc player tests in Section 8, and the full-spectrum audio amplifier tests in Section 9. In contrast, a stand-alone rack-mount audio amplifier would likely only be subject to the power mode tests in Section 7 and the full-spectrum audio amplifier tests in Section 9.

3 DEFINITIONS
Unless otherwise specified, all terms used in this document are consistent with the definitions contained in the ENERGY STAR Eligibility Criteria for Audio/Video.

4 TEST SETUP
A) Test Setup and Instrumentation: Test setup and instrumentation for all portions of this procedure shall be in accordance with the requirements of IEC 62301, Ed. 2.0, “Measurement of Household Appliance Standby Power”, Section 4, “General Conditions for Measurements.” In the event of conflicting requirements, the ENERGY STAR test method shall take precedence.

B) Input Power: Input power shall be as specified in Table 1 and Table 2.

</table>

C) Ambient Temperature: Ambient temperature shall be from 18 °C to 28 °C.
D) Relative Humidity: Relative humidity shall be from 10% to 80%.

5 TEST CONDUCT
A) As-shipped Condition: Products must be tested in their “as-shipped” configuration. For products that offer a choice of user-configurable options, all options shall be set to their default condition. If the device has different low power modes that can be manually selected, the measurement shall be taken with the device in the version of the mode that the power button on the remote control or front panel will initiate.

B) Unit Under Test (UUT) Control: The UUT shall be controlled with the factory-supplied remote control (I/R or RF) to the extent possible. For units that do not ship with a remote control, or for functions that cannot be exercised with the supplied remote control, control interfaces on the face or body of the UUT may be used.

C) Measurement Location: All power measurements shall be taken at a point between the ac power source and the UUT.

D) Multi-component Systems: For products composed of multiple components in separate housings, all components shall be connected together in a typical end-use configuration. Power shall be measured at each unique plug connection to the power source.

E) Signal Input Location: If the UUT does not have accessible signal input terminals, test signal input may be through the device antenna, optical disc player, or other accessible means typical of customer use.
F) **Audio Sources:** A 1 kHz sine wave input signal shall be used as the audio source for all amplifier tests in Section 9. For stereo testing, sine wave signals shall be in-phase, with identical frequency.

G) **Video Sources:** SD and HD “dynamic broadcast” video content from IEC 62087 Ed. 3.0 shall be used as the video source for optical disc player tests in Section 8.

H) **Option to Test with Only HD Video Sources:** If the UUT is found to have negligible differences in power when processing SD and HD video sources, tests with SD video sources may be eliminated, and all testing performed only with HD video sources.

I) **Output Volume:** UUT output volume shall be set to minimum for the duration of all tests except as noted in the audio amplifier test procedures in Section 9.

J) **Battery Powered Devices:** If the UUT contains rechargeable batteries, or can be integrated with another device that contains rechargeable batteries, all batteries shall be fully charged prior to the start of testing and shall remain in place for the duration of testing.

K) **Amplifiers:**
   1) For devices with multiple independent audio amplifiers, all amplifiers shall be connected and tested simultaneously.
   2) Products that offer surround sound processing shall be tested in the default surround sound mode.

L) **Speaker Outputs:**
   1) If the UUT includes speaker outputs, connect a resistive load across each pair of output terminals equivalent to the minimum nominal rated load impedance (e.g., 6 ohm if rated 6–8 ohm). The same resistive load shall be used for all amplifier tests.
   2) For self-powered or internal speakers with no accessible output terminals, output power must be measured across the speaker input leads, using the attached speaker as the load.

M) **AV Signal Interconnections:** If the UUT offers several audio and video interconnection options, select and configure the system with one of the following interconnections, in order of preference: HDMI, component, S-video, and composite. Only the connections needed to perform the test shall be connected at the time of test.

N) **Networking / Control Protocols:** If the UUT offers several Networking / Control Protocol options, each must be active and tested through all phases of the test procedure. Protocols may be either:
   1) Configured independently, with testing repeated for each available option; or
   2) Configured simultaneously, in order to expedite testing.

### 6 PRE-TEST UUT INITIALIZATION

A) Prior to the start of testing, the UUT shall be initialized as follows:
   1) Set up the UUT per the instructions in the supplied operating manual.
   2) If the UUT includes rechargeable batteries, ensure that all batteries are in a fully-charged state.
   3) Connect the UUT to the power source.
   4) Power on the UUT and perform initial system configuration, as applicable.
   5) Ensure that all audio tone controls are set to mid-level.
   6) Ensure that UUT settings (display brightness, etc.) are in their as-shipped configuration.
   7) Connect the UUT to the signal source and test equipment. The input signal shall comply with the requirements in Section 5, above.
8) Wait for 15 minutes, or until the unit has completed initialization and is ready for use.
9) Measure and record the ac input voltage and frequency.
10) Measure and record the test room ambient temperature.

7 TEST PROCEDURES FOR ALL PRODUCTS

The following tests shall be performed on all products.

7.1 Auto Power Down (APD) Function
1) Configure the UUT in a typical On Mode, Active State, with APD timing set to the default value.
2) Stop the UUT from performing any Primary Functions and turn off any input signal applied to active AV inputs to cause the UUT to APD.
3) Begin measuring the elapsed time to APD after the product ceases performance of all Primary Functions due to disconnection of signal.
4) Measure and record the average power before APD over a 2 minute period.
5) Allow the UUT to automatically power-down.
6) Verify that the device is in the expected APD low-power state and record the time to APD.
7) Measure and record the average power after APD over a 2 minute period.

7.2 Idle State
1) Configure the UUT in a typical Sleep Mode or Off Mode operational state.
2) Press the power button or otherwise switch the unit into an On Mode operational state, such that no active content is playing.
3) Wait at least 60 seconds.
4) Measure and record the average power over a 2 minute period.

7.3 Sleep Mode
1) Configure the UUT in a typical On Mode operational state.
2) Switch the UUT into a Sleep Mode low-power operational state.
3) Measure and record the average power over a 2 minute period.

8 TEST PROCEDURES FOR OPTICAL DISC PLAYERS

The following tests shall be performed on any product capable of playback or recording of audio and/or video on optical disc media (e.g., CD, DVD, Blu-ray Disc). Tests shall be performed with both SD and HD video sources for devices capable of processing both SD and HD content.

8.1 Video Playback Test
1) Insert / install the removable media and begin playback of IEC 62087 SD video content.
2) Measure and record the average power over a 2 minute period.
3) If the UUT is capable of playing HD content, repeat the test with IEC 62087 HD video content and record the average power over a 2 minute period.
8.2 Audio Playback Test

1) Insert / install the optical disc media with a 1 kHz sine wave signal per Section 5.F) and begin playback.

2) Measure and record the average power ($P_{\text{DISC}}$) over a 2 minute period.

9 TEST PROCEDURES FOR PRODUCTS WITH AUDIO AMPLIFICATION

1) Connect an input of the UUT to a generated 1 kHz sine wave input signal per Section 5.F).
   
   i) For devices that accept only digital input signals, generate a representation of a 1 kHz sine wave.
   
   ii) For devices without AV inputs, play back an audio disc with a 1 kHz sine wave signal per Section 8.2.
   
   iii) If 1 kHz is outside the range of any bandwidth-limited channel in the UUT and the UUT has AV inputs, sweep the input signal frequency between the upper and lower -3 dB points of each channel. Record the input signal frequency when the UUT input power is at its maximum and use this frequency for the bandwidth-limited channel for the remainder of the test.

2) Monitor each channel, one at a time, with a distortion analyzer and power meter.

3) Set the volume of the UUT to 100% and adjust the amplitude of the input signal until the THD of one or more channels is 1% or greater. For devices without AV inputs that are tested with an audio disc, adjust the volume until the THD of any single channel is 1% or greater.

4) Identify the channel or channels with the greatest output power. These shall be considered the reference channels and their output power shall be considered the Maximum Undistorted Power (MUP).\(^1\)

5) Measure and record the input power.

6) Reduce the input signal amplitude until the output power of the reference channel(s) is at 1/8 MUP. For devices without AV inputs that are tested with an audio disc, adjust the volume until the output power of the reference channel(s) is at 1/8 MUP.

7) Measure and record the input power ($P_{\text{IN}}$).

8) With the reference channel(s) at 1/8 MUP, measure and record the output power for all channels, averaged over a 2 minute period. Record the sum ($P_{\text{OUT}}$) of all output power measurements.

---

\(^1\) If the UUT performs signal processing such that the amplifier output does not clip, maximum undistorted power shall be obtained by monitoring input signal amplitude and output power simultaneously to identify the point beyond which output power remains constant despite increases in input signal amplitude.
