

-Table 3.0: We would like to understand the selection of these values. The temperate is the normally agreed ambient and the hot is close to the maximum normal operating temperature. But the cold value at -7C appears above the lower normal operating temperature range . As a Canadian manufacturer, with significant north American deployments, our experience suggests that the DC charger is likely to see lower temperature for long periods of time during the winter months in many US and Canadian colder-climate deployment areas. Can you please confirm the selection process that took place when selecting this value?

Thanks! And thanks for keeping us engaged.
Christina
