

Fujitsu Technology Solutions appreciates the opportunity to comment the ENERGY STAR® Specification for Computer Servers Version 3.0 Draft 3.

- Draft 3, Eligibility Criteria: 6.1.2. line 649  
There is a reference to “idle state power allowance”, which is obsolete with draft 3.
- Draft Test Method: 5.1 line 93 ff  
In 5.1 D) is required that UUTs have all PSUs connected and operational during testing. Does this means that tests of a low-end performance configuration with one PSU are not allowed, when the server can also be powered by redundant PSU? Is the product family certificate for a server with redundant PSU still valid for configurations with one, non-redundant PSU?
