Subject: RE: ENERGY STAR Storm Windows Version 1.0 Final Draft Specification

Doug: Is this meant to say **primary** or did you mean Energy Star certified **storm windows**?

Thanks

Jim Krahn

Do your current windows have metal frames? It is very important to use thermal breaks (small non-metal separators) when installing ENERGY STAR certified **primary** windows over metal-framed primary windows. Storm windows typically have aluminum frames, and this can conduct outside heat or cold through the metal frame of the primary window, diminishing the expected comfort and energy savings
