

Measuring and Assessing Light Source Flicker

Andrew Bierman

Lighting Research Center, Rensselaer Polytechnic Institute

ENERGY STAR® Lighting Webinar Series
June 30, 2016

What is flicker?

- ◆ Rapid fluctuation of light output over time
 - › Unintentional result from operating on 50/60 Hz line power
 - › Can be intentional to control light output
 - For example, pulse width modulation (PWM)

Types of flicker

◆ Periodic

- › Often intentional, e.g. PWM
- › Consequence of ac power

◆ Non-periodic

- › Unintentional
- › Often the result of something not working properly
 - End of life
 - Driver/dimmer/lamp incompatibility
 - Power line disturbances

Measuring flicker

$$\text{Percent Flicker} = \frac{(max - min)}{(max + min)}$$

For sinusoidal wave shapes:

$$\text{Percent Flicker} = \frac{\text{Amplitude}}{dc}$$

Percent flicker provides no information about the frequency or wave shape.

Measuring flicker

$$\text{Flicker Index} = \frac{\text{Area 1}}{\text{Area 1} + \text{Area 2}}$$

Flicker index depends on both modulation depth (percent flicker) and wave shape

Works well for specific types of flicker, e.g. 60 Hz, periodic

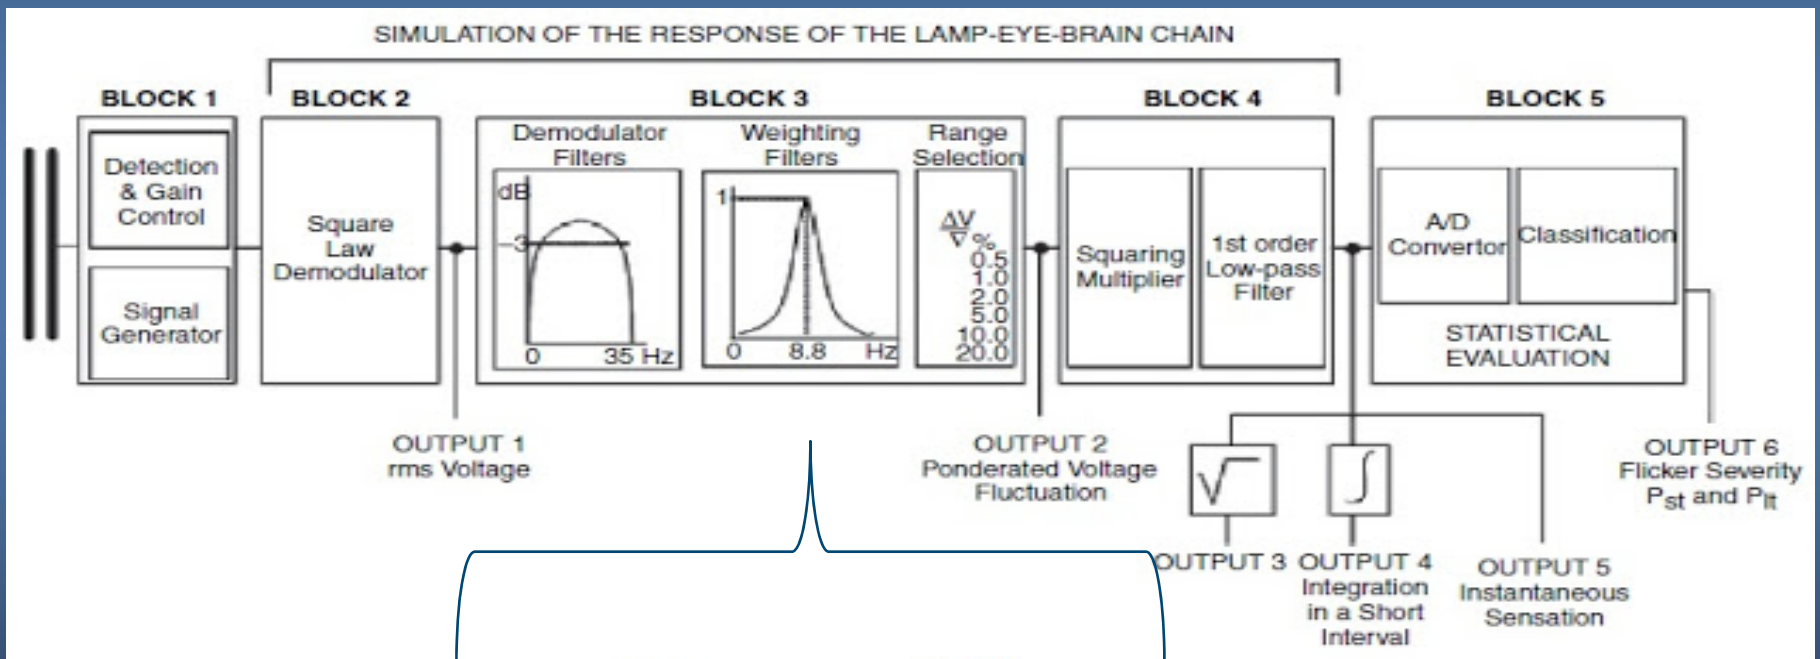

Adapted from IES Lighting Handbook, 9th Edition

Measuring flicker

♦ IEC Flicker Meter

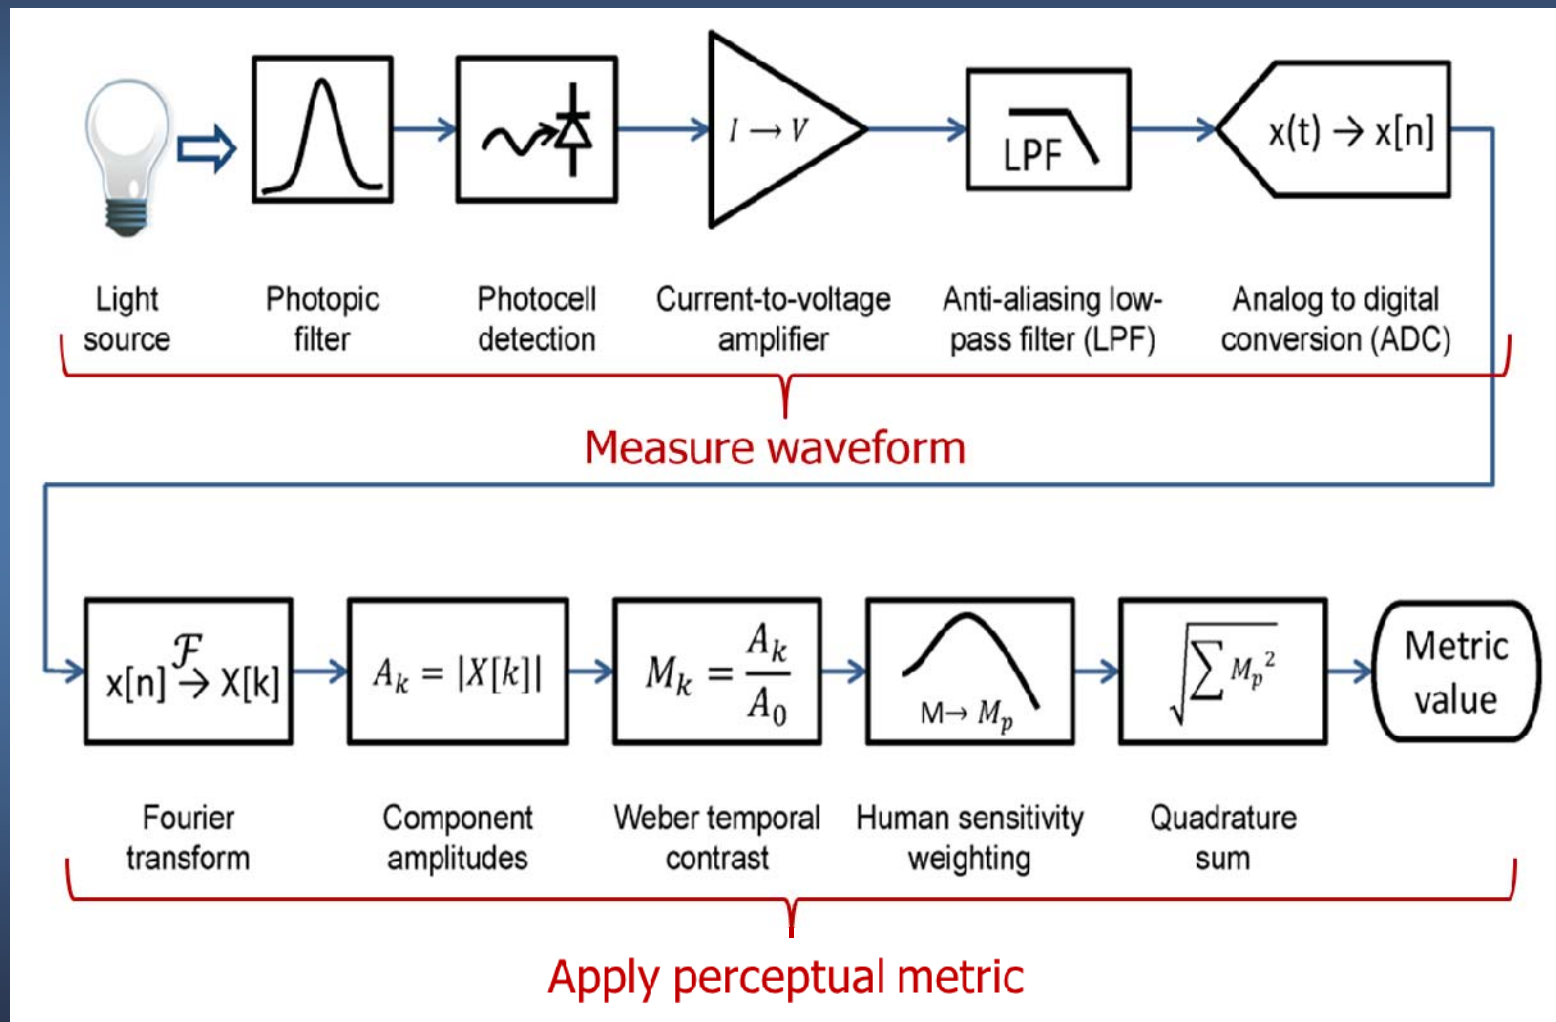

- › Flicker from incandescent lamps due to powerline disturbances
- › Could be simplified when measuring light output directly

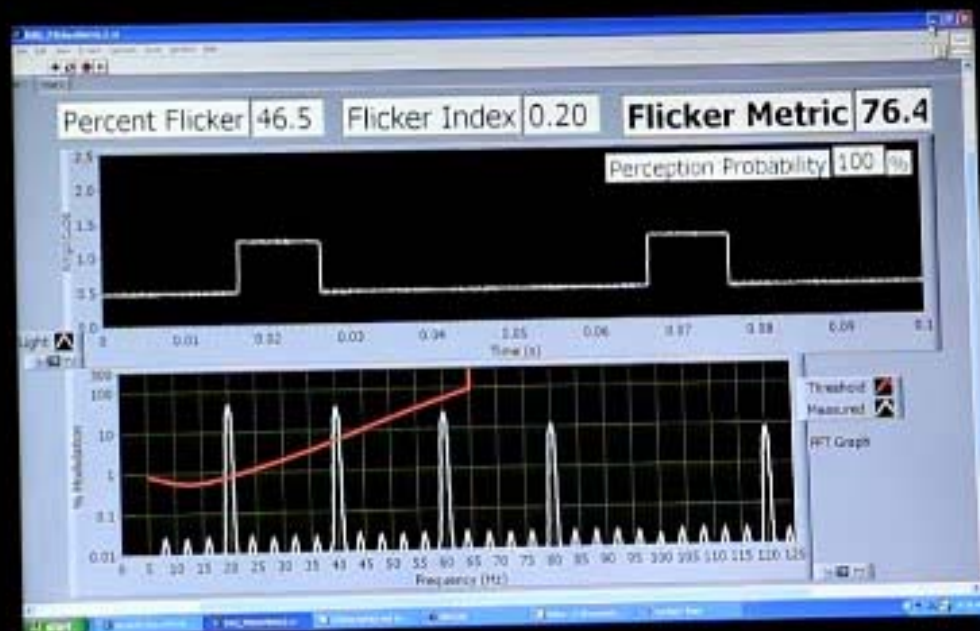

$$F(s) = \frac{k\omega_1 s}{s^2 + 2\lambda s + \omega_1^2} \times \frac{1 + s/\omega_2}{(1 + s/\omega_3)(1 + s/\omega_4)}$$

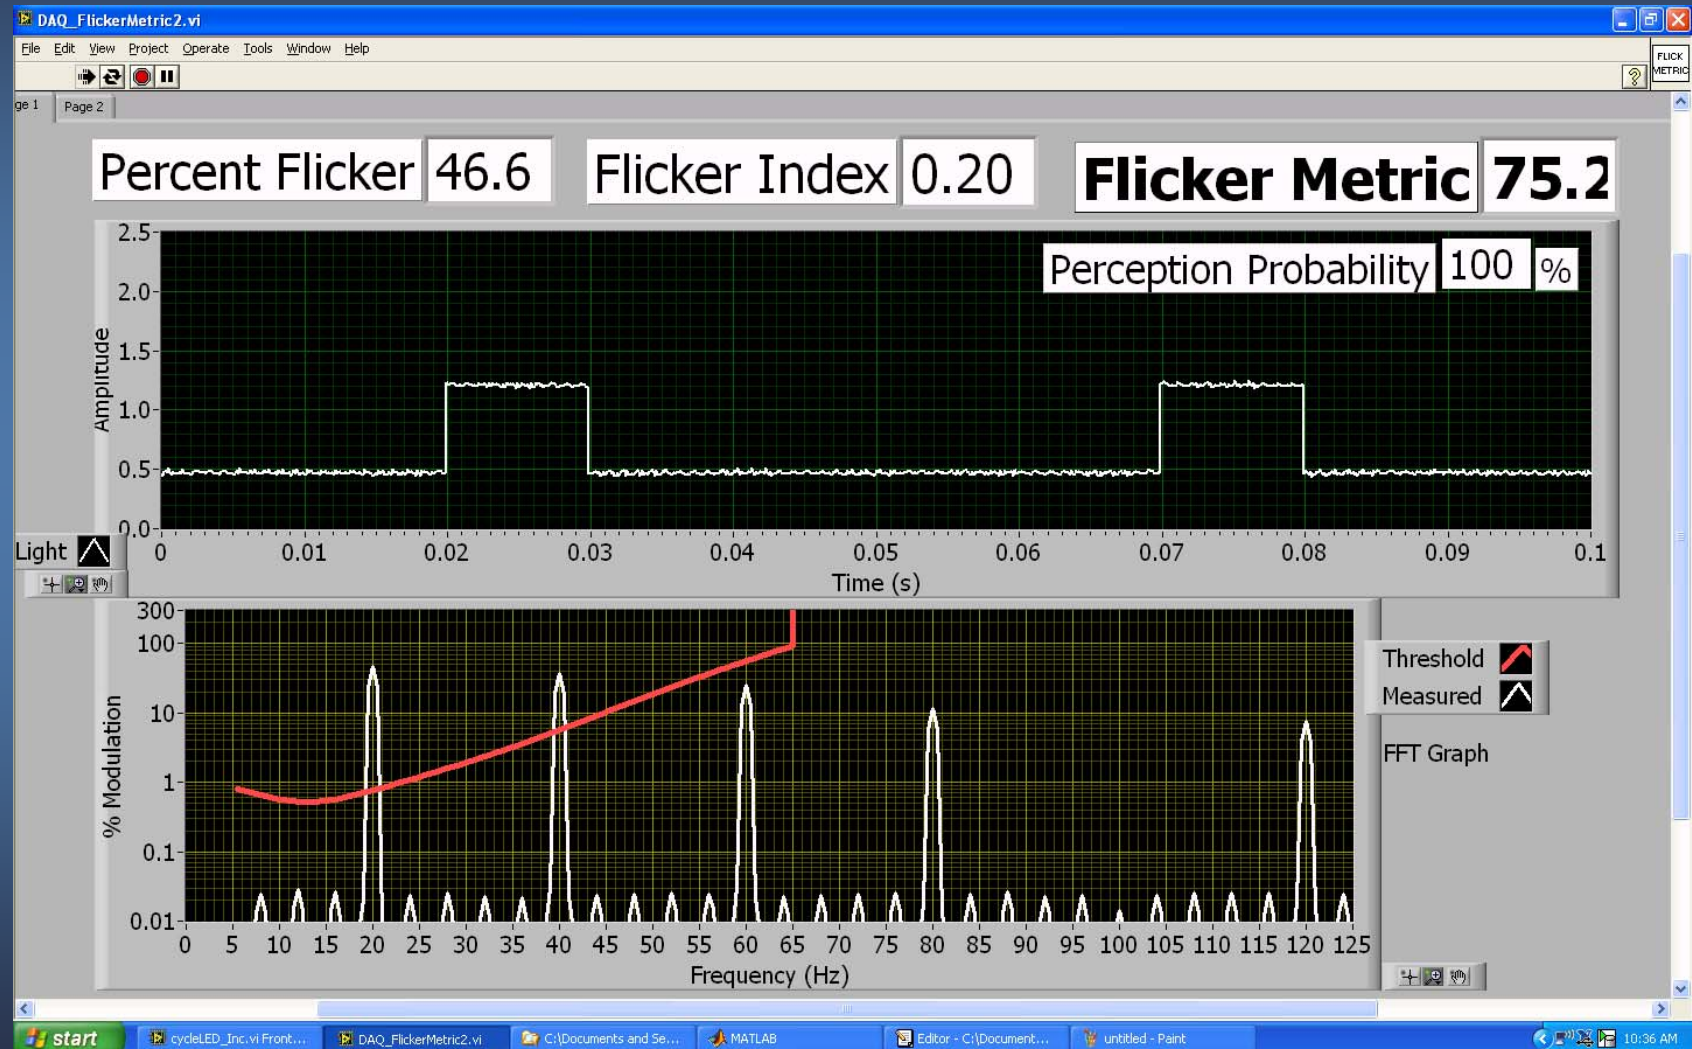

IEC 61000-4-15:2010

ASSIST Flicker Metric

Periodic Flicker waveform: Obvious flicker

Periodic flicker waveform: No flicker

An example for metric comparison

| | | | | |
|-----------------|-------|---------------------|-------|--------------------|
| | 47 | ← Percent Flicker → | 76 | |
| Visible flicker | 0.075 | ← Flicker Index → | 0.073 | No Visible flicker |
| | 35 | ← Flicker Metric → | 0.3 | |

Testing LED screw-base lamps with dimmers

Test conditions

- ◆ 20 lamp types
- ◆ 5 dimmer types
- ◆ 21 tests per lamp
 - 10 measurements / condition
 - 4200 waveforms acquired
 - 20 lamps x 21 tests x 10 repetitions

Measurements

- ◆ Percent Flicker
- ◆ Flicker Index
- ◆ ASSIST Flicker Metric

| | |
|--|--------------------------------------|
| | Did not observe flicker |
| | Perceived minimal flicker, undecided |
| | Definitely see flicker |

| Test condition | 4-lamp | 1-lamp | 4-lamp |
|----------------|-----------|--------|--------|
| Bypass | 1 | | |
| DIM at MAX | | 5 | 5 |
| DIM at min | | 5 | 5 |
| Total | 21 | | |

| | | Flicker observations | | | | | | | | | |
|---------|------------|----------------------|----|----|----|----|--------|----|----|----|----|
| | | 1-LAMP | | | | | 4-LAMP | | | | |
| Lamp ID | | D1 | D2 | D3 | D4 | D5 | D1 | D2 | D3 | D4 | D5 |
| I | Bypass | | | | | | | | | | |
| | Dim at MAX | | | | | | | | | | |
| | Dim at MIN | | | | | | | | | | |

Testing procedure

- ◆ Stabilize with dimmer bypassed according to IES LM79-08
 - › Light output and power variation $< 0.5\%$ over 30 minutes
 - › Ambient temperature $25^{\circ} \pm 1^{\circ} \text{C}$
 - › Record maximum light output (MLO)
- ◆ Connect dimmer and test at maximum and minimum dimmer settings
 - › Minimum setting 20% of MLO, or as specified by manufacturer if lower
 - › Stabilize to $< 0.5\%$ variation over 2.25 minutes

Dimmers used

- ◆ 5 Different dimmer types
 - › Forward phase, incandescent, magnetic low voltage (2 models)
 - › Forward phase, incandescent, CFL and LED (2 models)
 - › Reverse phase: electronic low voltage (1 model)

Forward phase

Reverse phase

Results: Flicker during dimming

Observed

Flicker Metric

| Test condition | Observed | Correctly predicted | Accuracy of prediction |
|-------------------------|----------|---------------------|------------------------|
| Did not observe flicker | 387 | 386 | 99.7% |
| Undecided | 15 | 6 | 40% |
| Definitely see flicker | 18 | 14 | 88% |

| | |
|--|--------------------------------------|
| | Did not observe flicker |
| | Perceived minimal flicker, undecided |
| | Definitely see flicker |

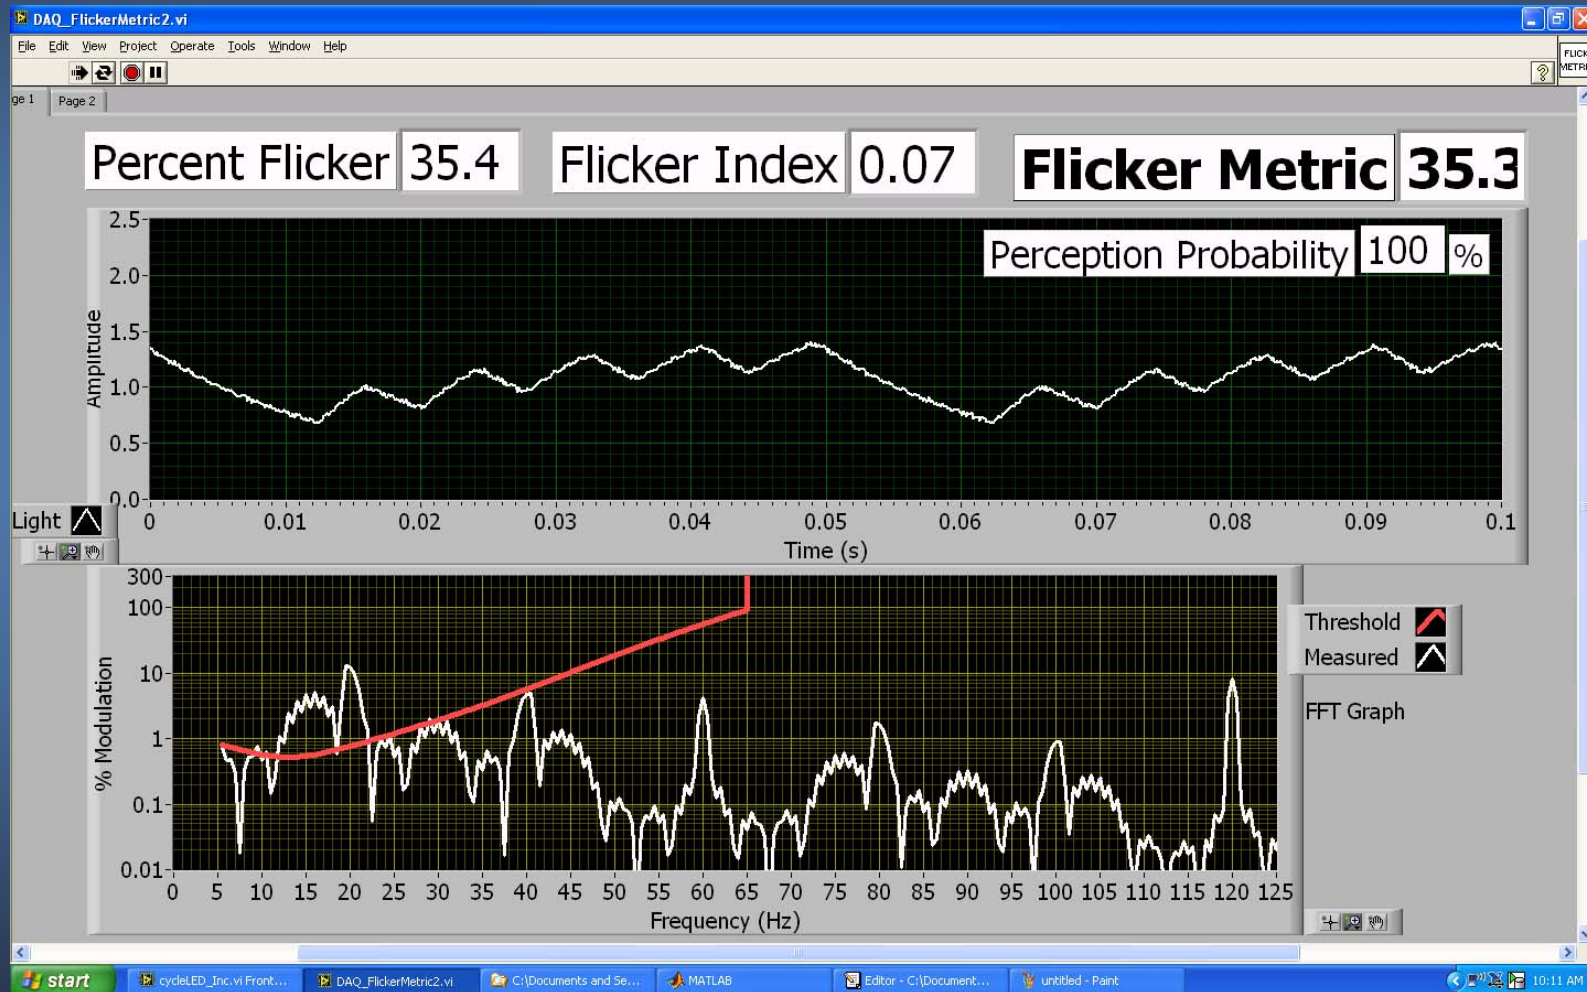

LED A-lamp on dimmer: No Flicker

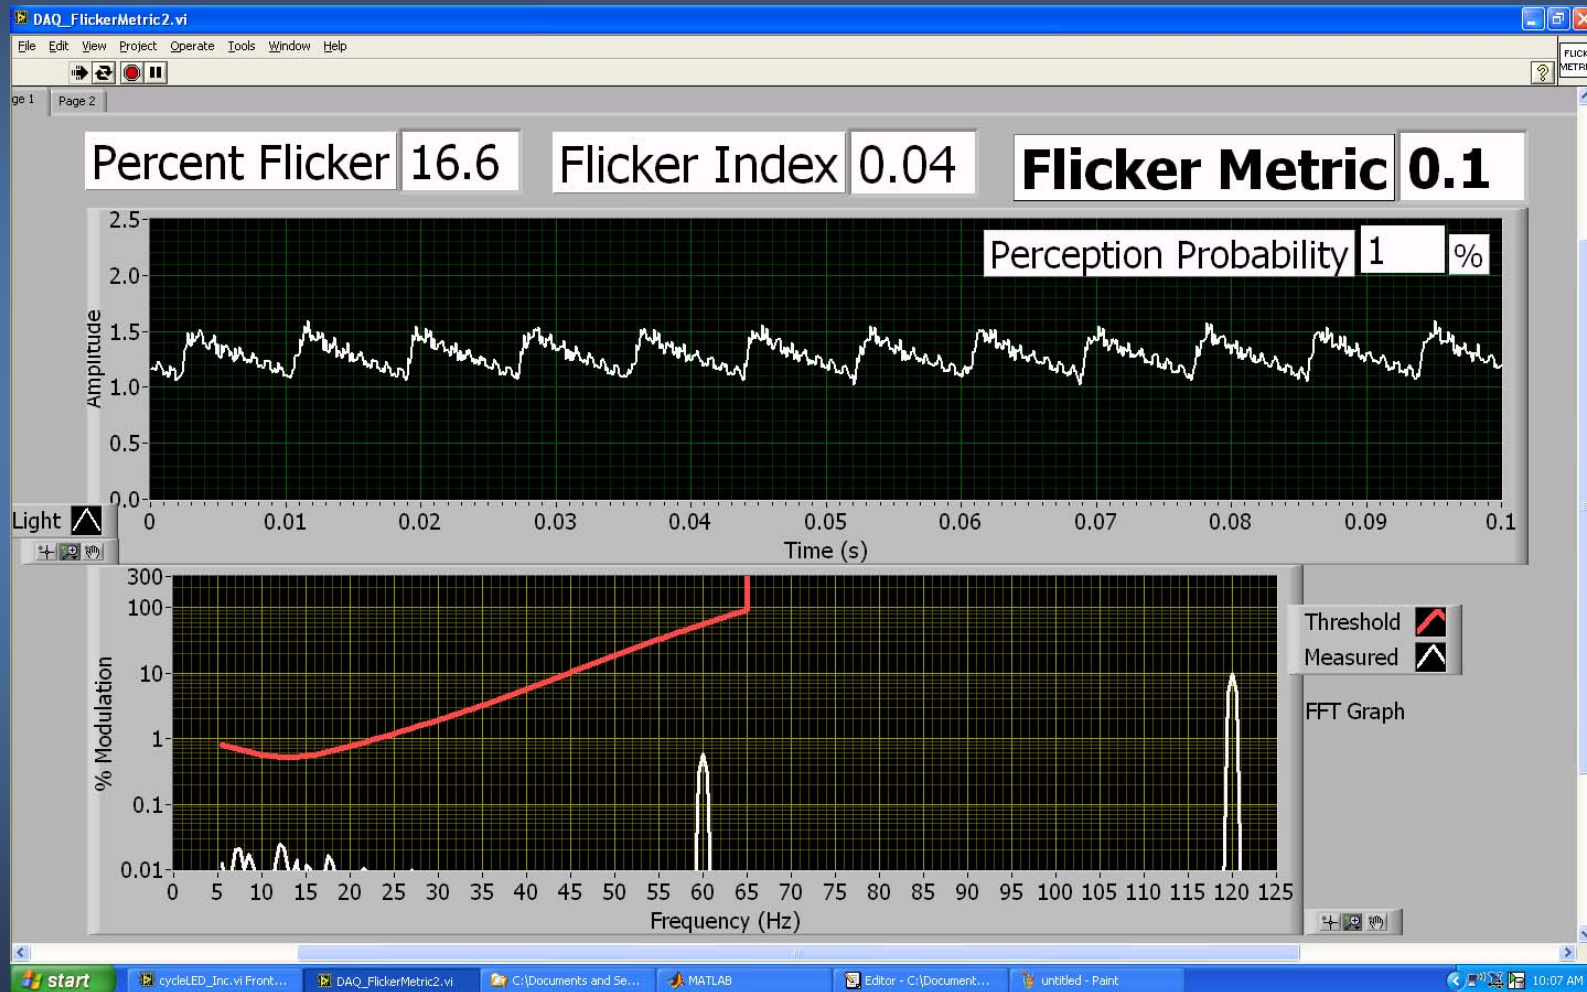

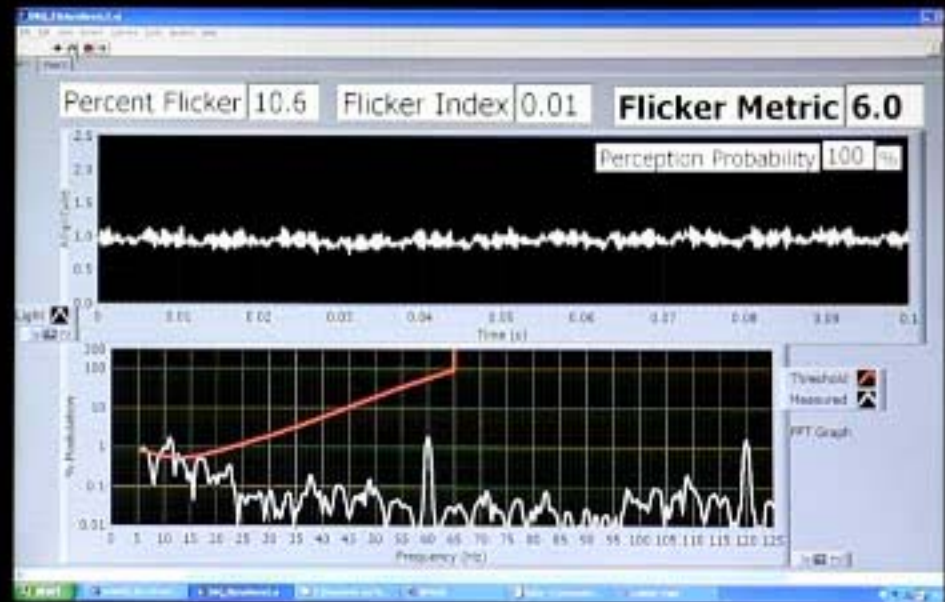

LED A-lamp on dimmer: Obvious Flicker

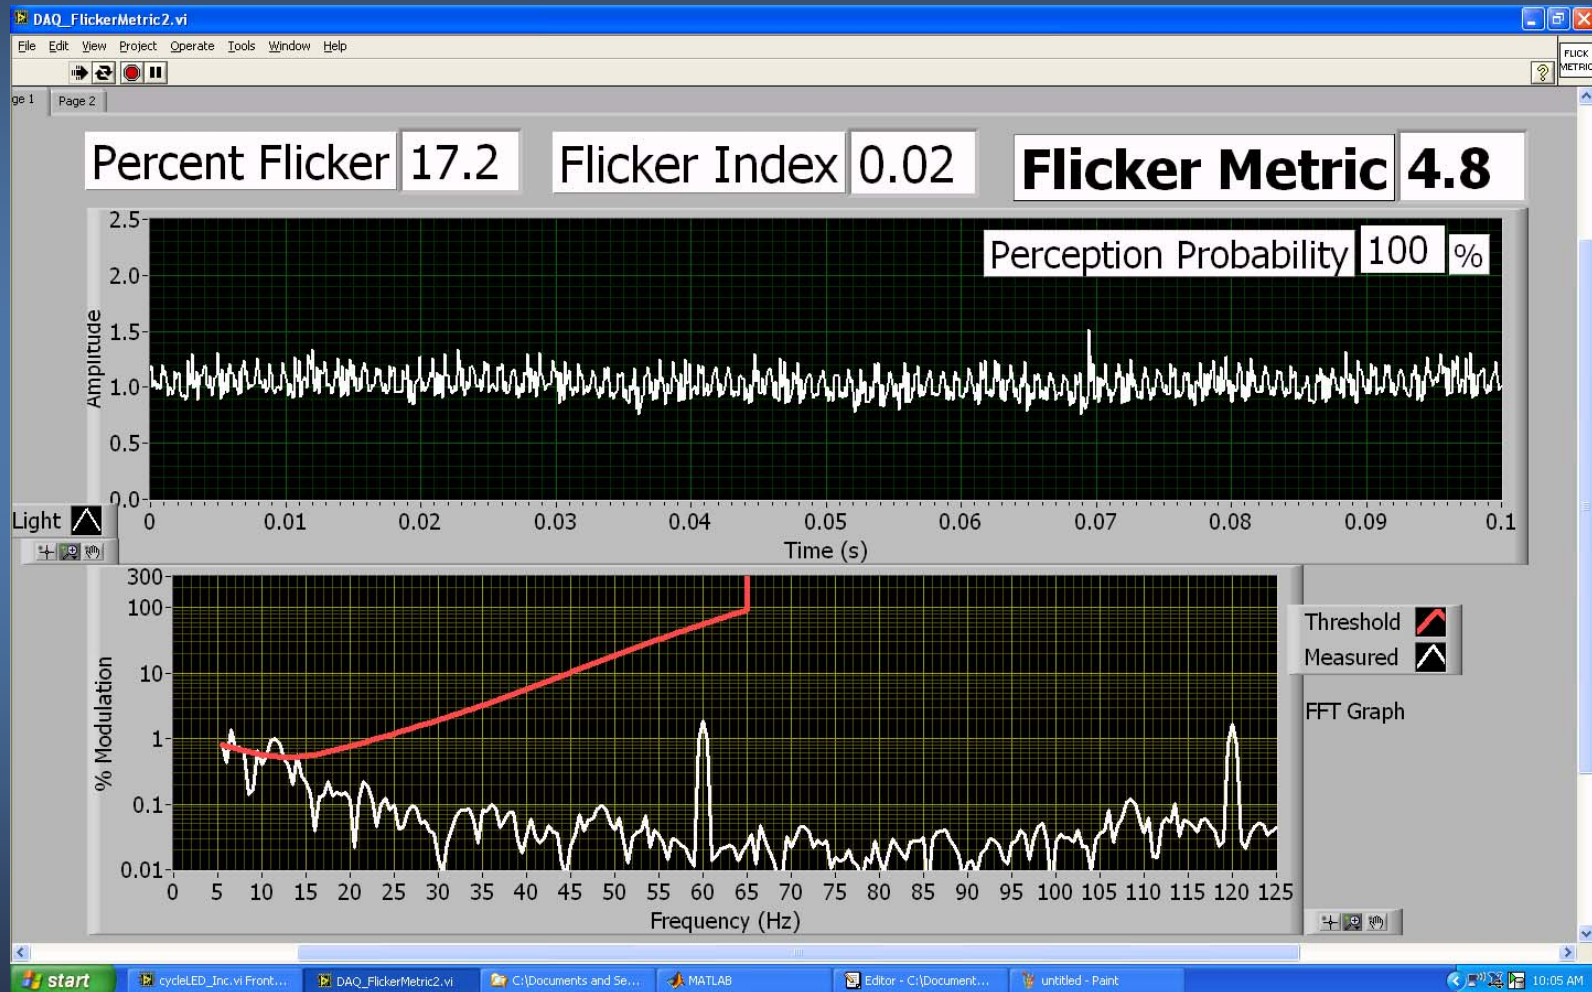

LED A-lamp on dimmer: No Flicker

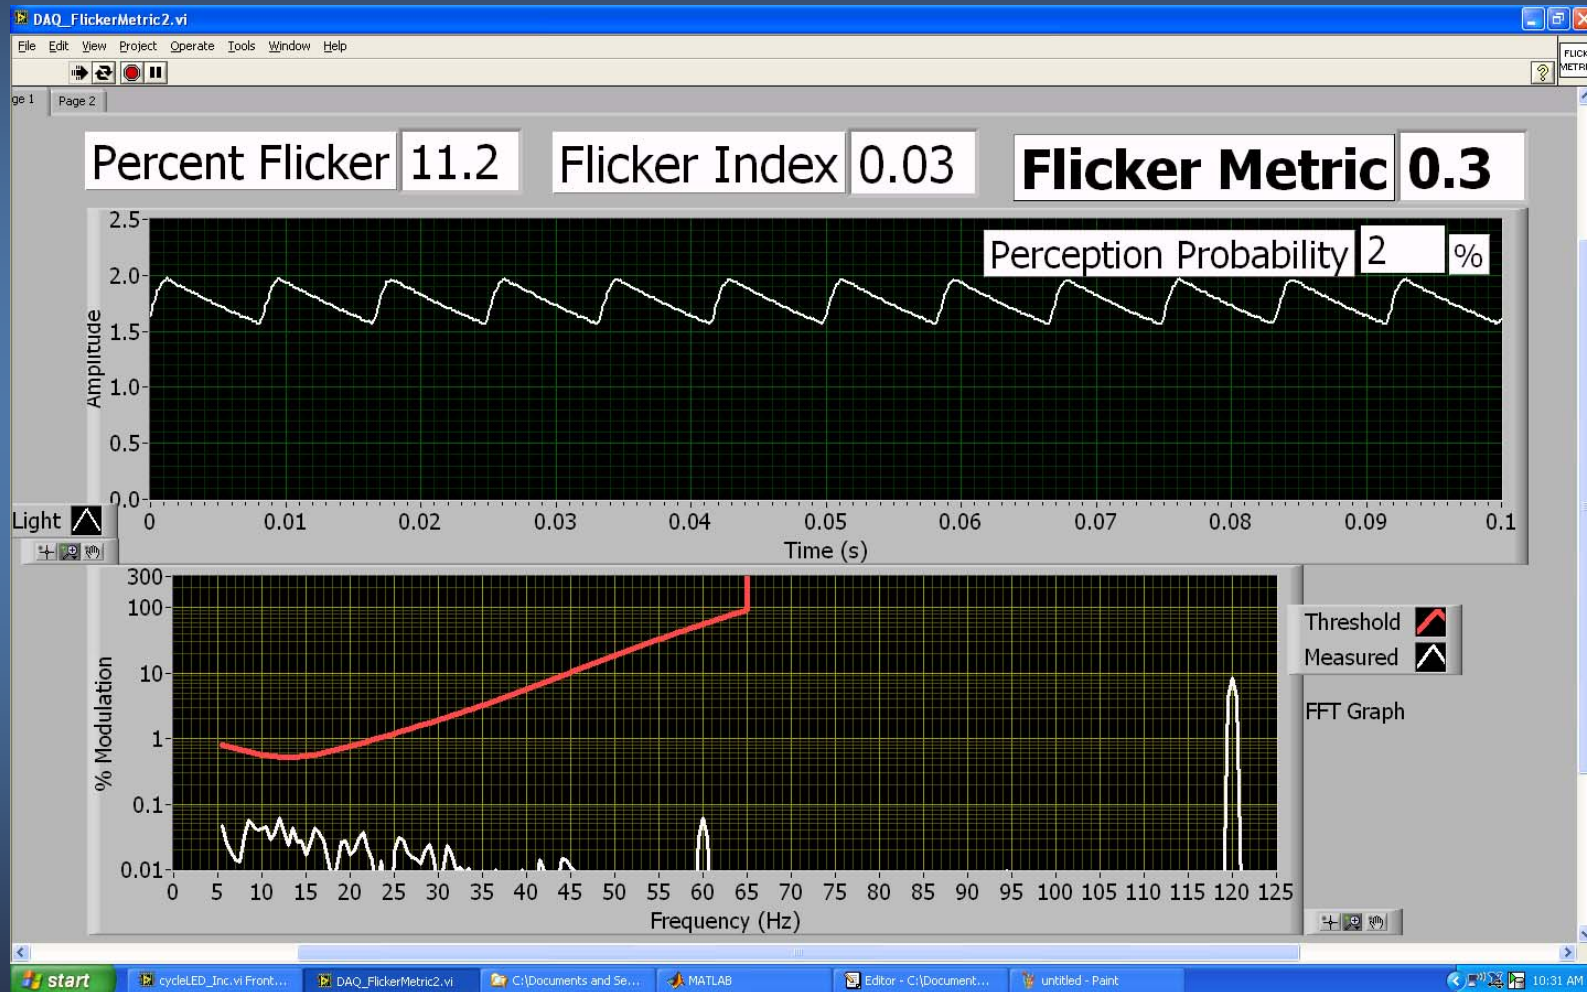

LED A-lamp on dimmer: Noticeable Flicker

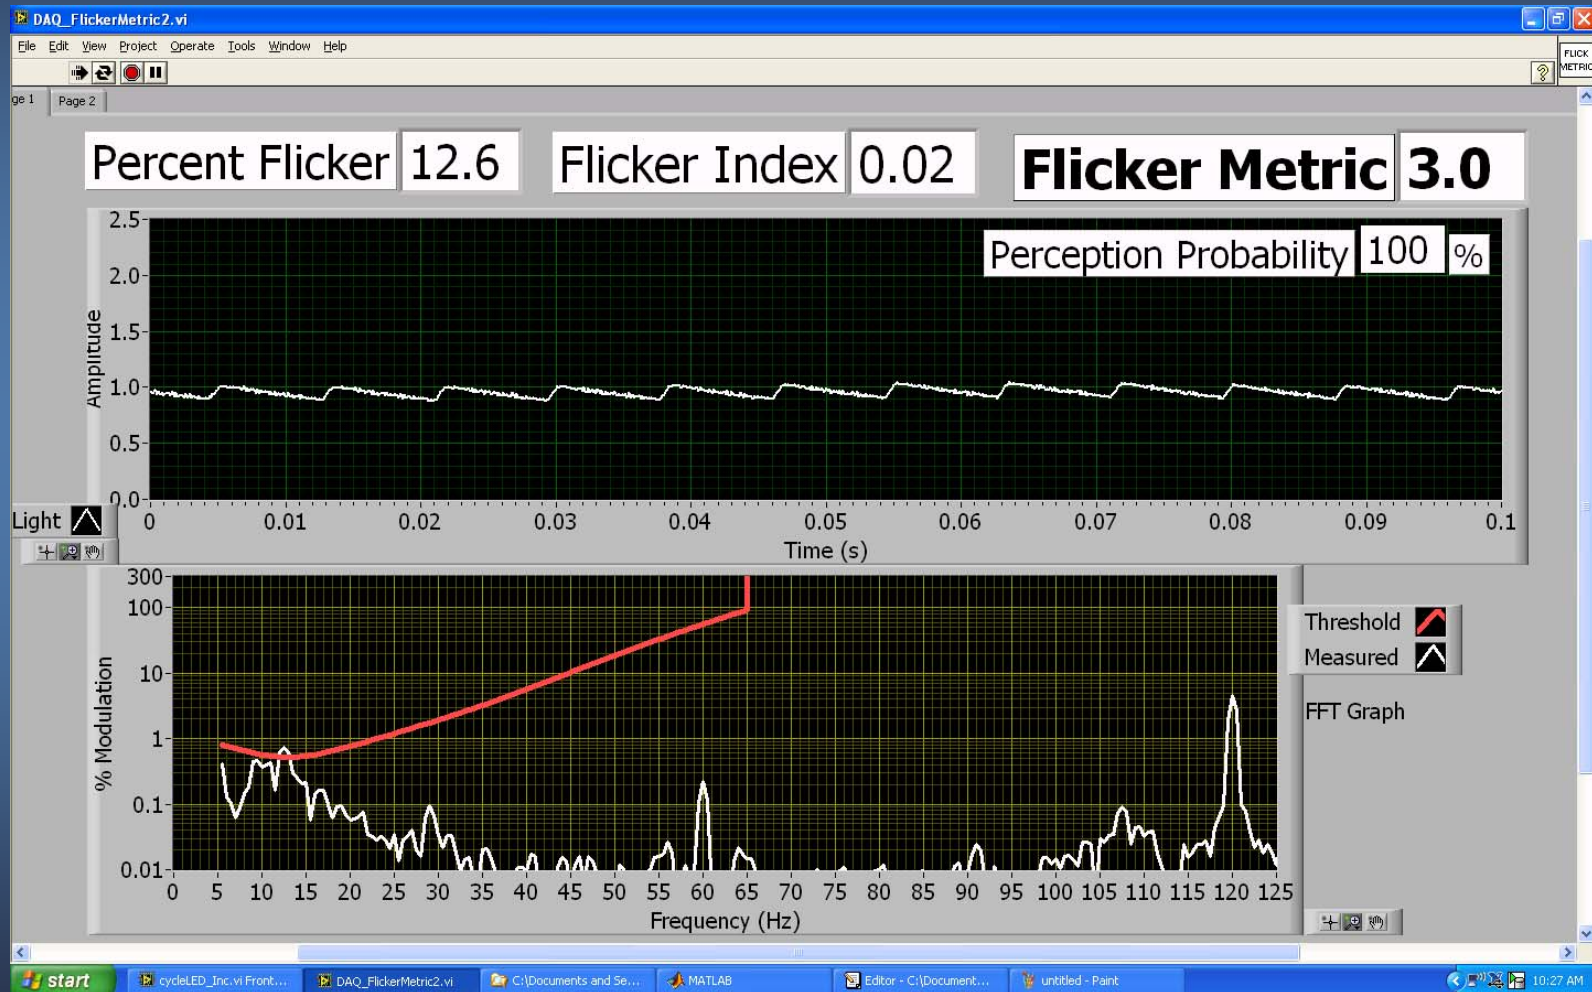

LED A-lamp on dimmer: No Flicker

LED A-lamp on dimmer: Noticeable Flicker

Test methodology comments

- ◆ A bandwidth requirement is needed for measuring light output waveforms. "Less than 5% attenuation (-26 dB) from dc to 500 Hz."
- ◆ An amplitude resolution requirement is needed. "Must resolve $< 0.1\%$ change in light level."
- ◆ Some lamp/dimmer combinations would not stabilize when dimmed; output and power input would oscillate. Used steady-state criterion.
- ◆ Test time dominated by stabilization
 - › Ranged from 2 to 5+ hours per lamp tested on 5 dimmers
- ◆ A 5% light output tolerance at 20% (or less) is difficult and sometimes impossible to achieve. Requires a stability of 0.25% of full scale.
 - › Express all light output tolerances a percentage of maximum light output
- ◆ Sample more waveforms spaced over longer time interval in order to catch the transient, stochastic nature of flicker for some products
