**Subject: Comments on ENERGY STAR Version 2.0 Room Air Cleaners Final Draft Specification**

Blueair has reviewed the ENERGY STAR Version 2.0 Room Air Cleaners Final Draft Specification and have the following comments:

- 3.2.1: We suggest that the applicable standard (UL867) is added
- 3.4: We believe it should be clarified if “Partial On Mode” for a model with network connection capabilities is only tested with the connection capabilities activated or if tests will be done with and without the capabilities activated to determine that the partial on mode while not connected is  $\leq 1W$  and the partial on mode while connected is  $\leq 2W$ . In other words, is the Partial on mode requirement for models with network connection capabilities 1W+1W or 2W?
