4.2 HVAC Design Report reviewed by Rater for the following parameters (HVAC Design Report Item # indicated in parenthesis)\textsuperscript{10}:

4.2.1 Prescriptive Path: Dwelling Unit Mechanical Ventilation (Item 2.7) is <150% of ASHRAE 62.2-2013 requirements \textsuperscript{11} \hfill \checkmark \checkmark \\
4.2.2 Cooling season and heating season outdoor design temperatures used in loads (Item 3.4) are within the limits defined at energystar.gov/hvacdesigntemps for the State and County where the building will be built, or the designer has provided an allowance from EPA to use alternative values \textsuperscript{12} \hfill \checkmark \\
4.2.3 Number of occupants used in loads (Item 3.6) is within \pm 2 of the dwelling unit to be certified and occupant gains (Item 3.7) do not exceed 645 Btuh per occupant \textsuperscript{13} \hfill \checkmark \\
4.2.4 Conditioned floor area used in loads (Item 3.8) is between 100 sq. ft. smaller and 300 sq. ft. larger than the dwelling unit to be certified \hfill \checkmark \\
4.2.5 Window area used in loads (Item 3.9) is between 15 sq. ft. smaller and 60 sq. ft. larger than the dwelling unit to be certified, or for dwelling units with > 500 sq. ft. of window area, between 3% smaller and 12% larger than the dwelling unit to be certified \hfill \checkmark \\
4.2.6 Predominant window SHGC used in loads (Item 3.10) is within 0.1 of predominant value in the dwelling unit to be certified \textsuperscript{14} \hfill \checkmark \\
4.2.7 Mechanical ventilation used in loads (Item 3.12) is the same as the ventilation design (Item 2.7) for the given unit plan \hfill \checkmark \checkmark \\
4.2.8 Non-occupant internal gains (Item 3.13) are less than 3,600 Btuh \hfill \checkmark \\
4.2.9 Sensible & total heat gain are documented (Items 3.14, 3.16) for the orientation of the dwelling unit to be certified \textsuperscript{15} \hfill \checkmark \\
4.2.10 Cooling sizing % (Item 4.18) is within the cooling sizing limit (Item 4.19) selected by the HVAC designer \hfill \checkmark \checkmark \\

5. Construction Document Review – Recommended, not required

5.1 Air Sealing: Review construction documents to verify that air-sealing details to exterior and unconditioned spaces are represented which, at a minimum, demonstrate compliance with field checklist items in Section 4 of the Rater Field Checklist (noted with an asterisk). Items 5.1.9 and 5.1.10 are not verified by the Rater in the field, but are recommended.

5.1.1 Ducts, flues, shafts, plumbing, piping, wiring, exhaust fans, & other penetrations to unconditioned space sealed, with blocking / flashing as needed* \hfill \checkmark \\
5.1.2 Recessed lighting fixtures adjacent to unconditioned space ICAT labeled and gasketed. Also, if in insulated ceiling without attic above, exterior surface of fixture insulated to \geq R-10 in CZ 4-8* \hfill \checkmark \\
5.1.3 Continuous top plate or blocking is at top of walls adjoining unconditioned space including at balloon-framed parapets, \hfill \checkmark
5.1 Drywall sealed to top plate at all unconditioned attic / wall interfaces using caulk, foam, drywall adhesive (but not other construction adhesives), or equivalent material. Either apply sealant directly between drywall and top plate or to the seam between the two from the attic above.*

5.1.5 Rough opening around windows & exterior doors sealed*17

5.1.6 Assemblies that separate attached garages from occupiable space sealed and, also, an air barrier installed, sealed, and aligned with these assemblies*

5.1.7 Attic access panels and drop-down stairs are gasketed (i.e., not caulked) or equipped with durable covers that are gasketed*18

5.1.8 Doors adjacent to unconditioned space (e.g., attics, garages, basements), ambient conditions, or a unit entrance to a corridor/stairwell, made substantially air-tight with doorsweep and weatherstripping or equivalent gasket*

5.1.9 Above-grade sill plates adjacent to conditioned space sealed to foundation or sub-floor. Gasket also placed beneath above-grade sill plate if resting atop concrete / masonry & adjacent to conditioned space19, 20

5.1.10 The gap between the common wall (e.g. the drywall shaft wall) and the structural framing between units sealed at all exterior boundaries

5.2 Dwelling Unit Compartmentalization

5.2.1 Review construction documents to verify that air-sealing details21 are represented such that air exchange between the dwelling unit and outside as well as the dwelling unit and other adjacent spaces is minimized and designed to achieve compartmentalization less than or equal to 0.30 CFM50 per square feet of dwelling unit enclosure area, following procedures in ANSI 380

5.2.2 Seal all spaces 5.1.1-5.1.10 on adiabatic unit enclosure assemblies

5.3 Prescriptive Path: Verify that Window-to-wall ratio ≤ 30% 22

5.4 Verify that thermal bridging details are in compliance with checklist items in Section 2 of the Rater Field Checklist

5.5 Verify that air barrier details are in compliance with field checklist items in Section 3 of the Rater Field Checklist

5.6 Verify that HVAC details are in compliance with checklist items in Sections 5 - 10 of the Rater Field Checklist

5.6.1 Verify that HVAC design includes access and means to measure the dwelling-unit mechanical ventilation airflow rate

5.6.2 Verify that bedrooms with design airflow ≥ 150 CFM are specified with a combination of transfer grills, jump ducts, dedicated return ducts, and / or undercut doors to achieve a Rater-measured pressure differential ≤ 5 Pa with respect to the main body of the house when the bedroom door is closed and all air handlers are operating

5.6.3 Verify that "FT Agent" holds credential required to complete the HVAC Functional Testing Checklist23

5.7 Verify that DHW, Lighting, Appliances, Ceiling Fans, Plumbing Fixtures, and Whole Building Utility Data Acquisition details are in compliance with checklist items in Sections 11 – 14 of the Rater Field Checklist

Rater Design Review Checklist Footnotes

1. This Checklist applies to all dwelling units, sleeping units, most common spaces\(^2\) on the property, and parking lots. This Checklist does not apply to commercial or retail spaces. This Checklist does not apply to common spaces that are located in buildings without any dwelling or sleeping units. The term ‘sleeping unit’ refers to a room or space in which people sleep, which can also include permanent provisions for living, eating, and either sanitation or kitchen facilities but not both. Where the term ‘dwelling unit’ is used in this Checklist, the requirement is also required of ‘sleeping’ units. The term ‘building’ refers to a structure utilized or intended for supporting or sheltering any occupancy for which at least 90% of its boundary is comprised of exterior walls.

2. The term ‘common space’ refers to any spaces on the property that serve a function in support of the residential part of the building that is not part of a dwelling or sleeping unit. This includes spaces used by residents, such as corridors, stairs, lobbies, laundry rooms, exercise rooms, residential recreation rooms, or parking garages used exclusively by residents, building staff, and their guests. This also includes offices used by building management, administration or maintenance and all special use areas located on the property to serve and support the residents such as day-care facilities, gyms, dining halls, etc.

3. The term ‘Rater’ refers to the person completing the third-party inspections required for certification. This person shall: a) be a Certified Rater, Approved Inspector, or an equivalent designation as determined by a “Multifamily Oversight Organization” and, b) have attended and successfully completed an EPA-recognized training class. See energystar.gov/newhomestraining. (Note: Link not updated)

4. All windows, doors and skylights must meet or exceed the U-factor and SHGC requirements specified in the table below. If no NFRC rating is noted on the window or in product literature (e.g., for site-built fenestration), select the U-factor and SHGC value from Tables 4 and 10, respectively, in 2013 ASHRAE Handbook of Fundamentals, Chapter 15. Select the highest U-factor and SHGC value among the values listed for the known window characteristics (e.g., frame type, number of panes, glass color, and presence of low-e coating). Note that the U-factor requirement applies to all fenestration whereas the SHGC only applies to the glazed portion.

* Classified as “Class AW” under the North American Fenestration Standard skylights (AAMAWDMA/ CSA 1011/S.2/A440)

The following exemptions apply:

i. An area-weighted average of fenestration products shall be permitted to satisfy the U-factor requirements;

ii. An area-weighted average of fenestration products ≥ 50% glazed shall be permitted to satisfy the SHGC requirements; and

iii. 5% of all combined fenestration area (glazed and opaque) shall be exempt from the U-factor and SHGC requirements, and shall be excluded from area-weighted averages calculated using i) and ii), above.

In Passive House (PHIUS+\(^+)\) certified buildings, where triple-glazed window assemblies with thermal breaks / spacers between the panes are used, such windows meet the intent of Items 2.1 and 2.2 and shall be excluded when assessing compliance of a) through d), above.

5. Where the term ‘ceiling’ is used, the component insulation levels for “roofs” shall be used and does not apply to adiabatic ceilings, such as the insulated or uninsulated ceiling between two dwelling units in a multistory building.

6. Items 3.1 and 3.2 are applicable to walls that are adjacent to other buildings or adjacent to unconditioned spaces within the building. Where the wall assembly includes continuous insulation that is interrupted by fasteners or service openings, an assembly U-factor must be calculated. For the interrupted portions, the continuous insulation cannot contribute to the assembly U-value and an overall U-value shall be calculated based on an area weighted ratio. Thermally broken shelf-angles are exempt from de-rating.

7. Specified levels shall meet or exceed the component insulation levels in 2009 IECC Table 502.2(1) or the table specified in the ENERGY STAR MF Reference Design. The following exceptions apply:

a. For ceilings with attic spaces, R-30 shall satisfy the requirement for R-38 and R-38 shall satisfy the requirement for R-49 wherever the full height of uncompressed insulation at the lower R-value extends over the wall top plate at the eaves. This exemption shall not apply if the alternative calculations in d) are used;

b. For ceilings without attic spaces, that are not roofs with insulation above deck, R-30 shall satisfy the requirement for any required value above R-30 if the design of the roof / ceiling assembly does not provide sufficient space for the required insulation value. This exemption shall be limited to 20% of the total insulated ceiling area. This exemption shall not apply if the alternative calculations in d) are used;

c. Common areas following the ENERGY STAR Reference Design should use the “All Other” column and also use the row of the table that best corresponds to the common area features. Unlike Prescriptive Path dwelling units, the common areas do not need to follow the row corresponding to a wood-framed building.

d. An alternative equivalent U-factor or total UA calculation may also be used to demonstrate compliance, as follows:

An assembly with a U-factor equal or less than specified in 2009 IECC Table 502.1.2 complies. A total building thermal envelope UA that is less than or equal to the total UA resulting from the U-factors in Table 502.1.2 also complies. The performance of all components (i.e., roofs, walls, floors, slabs-on-grade, and fenestration) can be traded off using the UA approach. Note that Items 1.5, 1.6, and 2.1 through 2.7 of the Rater Field Checklist shall be met regardless of the UA tradeoffs calculated. The UA calculation shall be done using a method consistent with the ASHRAE Handbook of Fundamentals and shall include the thermal bridging effects of framing materials. The calculation for a steel-frame envelope assembly shall use the ASHRAE zone method or a method providing equivalent results, and not a series-parallel path calculation method.
16. This Revision of the Rater Design Review Checklist is required to certify all multifamily projects permitted after TBD, but is allowed to be used for any multifamily project permitted or completed prior to this date. The Rater may define the ‘permit date’ as either the date that the permit was issued or the application date of the permit. In cases where permit or application dates are not available, Providers or Multifamily Oversight Organizations have discretion to estimate permit dates based on other construction schedule factors. These assumptions should be both defensible and documented.

15. Orientation represents the direction that the front door of the dwelling unit is facing. The designer is only required to document the loads for the orientation(s) that the dwelling unit might be built in. For example, if a unit plan will only be built in a specific orientation (e.g., facing South), then the designer only needs to document the loads for this one orientation.

14. “Predominant” is defined as the SHGC value used in the greatest amount of window area in the dwelling unit.

13. To determine the number of occupants among all HVAC systems in the dwelling unit, calculate the number of bedrooms, as defined by ANSI 301, and add one. The number of occupants used in loads must be within ±2 of the dwelling unit to be certified. A bedroom is defined by ANSI 301 as a room or space 70 sq. ft. or greater size, with egress window and closet, used or intended to be used for sleeping. A “den”, “library”, or “home office” with a closet, egress window, and 70 sq. ft. or greater size or other similar rooms shall count as a bedroom, but living rooms and foyers shall not. (This definition could be updated by future revisions to ANSI 301.) An egress window, as defined in 2009 IRC section R310, shall refer to any operable window that provides for a means of escape and access for rescue in the event of an emergency. The egress window definition has been summarized for convenience. The egress window shall:
   • have a sill height of not more than 44 inches above the floor; AND
   • have a minimum net clear opening of 5.7 sq. ft.; AND
   • have a minimum net clear opening height of 24 in.; AND
   • have a minimum net clear opening width of 20 in.; AND
   • be operational from the inside of the room without the use of keys, tools or special knowledge.

12. Visit energystar.gov/hvacdesigntemps for the maximum cooling season design temperature and minimum heating season design temperature permitted for ENERGY STAR certified homes and the process for a designer to obtain an allowance from EPA. The same design report is permitted to be used in other counties, as long as the design temperature limits in those other counties meet or exceed the cooling and heating season temperature limits for the county selected. For example, if Fauquier County, VA, is used for the load calculations, with a 1% cooling temperature limit of 93 F, then the same report could be used in Fairfax County (which has a higher limit of 94 F) but not in Arlington County (which has a lower limit of 92 F).

11. Raters may use this table to determine the maximum ventilation rate allowed.

10. The Rater shall collect one HVAC Design Report per building/project. Regardless of whether the “unit-specific design”, “group design”, or “worst-case design” box has been checked in Item 3.2 of the HVAC Design Report, the system design as documented on the HVAC Design Report must fall within the tolerances in Item 4.2 for the unit to be certified. The Rater is only responsible for verifying that the designer has not left any items blank on the HVAC Design Report and for verifying the discrete objective parameters in Item 4.2 of this Checklist, not for verifying the accuracy of every input on the HVAC Design Report.

9. Where an insulated wall separates a garage, patio, porch, or other unconditioned space from the conditioned space of the building, slab perimeter insulation shall also be installed at this interface to provide a thermal break between the conditioned and unconditioned slab, if the slab is in contact with the ground at that interface. Where specific details cannot meet this requirement, partners shall provide the detail to EPA to request an exemption prior to the building’s certification. EPA will compile exempted details and work with industry to develop feasible details for use in future revisions to the program. A list of currently exempted details is available at: energystar.gov/slabedge.

8. Consistent with the 2009 IECC, slab edge insulation is only required for slab-on-grade floors with a floor surface less than 24 inches below grade. Slab-on-grade perimeter insulation shall extend to the top of the slab to provide a complete thermal break. If the top edge of the insulation is installed between the exterior wall and the edge of the interior slab, it shall be permitted to be cut at a 45-degree angle away from the exterior wall. Alternatively, the thermal break is permitted to be created using ≥ R-3 rigid insulation on top of an existing slab (e.g., in a building undergoing a gut rehabilitation). In such cases, up to 10% of the slab surface is permitted to not be insulated (e.g., for sleepers, for sill plates). Insulation installed on top of slab shall be covered by a durable floor surface (e.g., hardwood, tile, carpet).

7. Orientation represents the direction that the front door of the dwelling unit is facing. The designer is only required to document the loads for the orientation(s) that the dwelling unit might be built in. For example, if a unit plan will only be built in a specific orientation (e.g., facing South), then the designer only needs to document the loads for this one orientation.

6. This Revision of the Rater Design Review Checklist is required to certify all multifamily projects permitted after TBD, but is allowed to be used for any multifamily project permitted or completed prior to this date. The Rater may define the ‘permit date’ as either the date that the permit was issued or the application date of the permit. In cases where permit or application dates are not available, Providers or Multifamily Oversight Organizations have discretion to estimate permit dates based on other construction schedule factors. These assumptions should be both defensible and documented.
17. In Climate Zones 1 through 3, a continuous stucco cladding system sealed to windows and doors is permitted to be used in lieu of sealing rough openings with caulk or foam.

18. Examples of durable covers include, but are not limited to, pre-fabricated covers with integral insulation, rigid foam adhered to cover with adhesive, or batt insulation mechanically fastened to the cover (e.g., using bolts, metal wire, or metal strapping.

19. Existing sill plates (e.g., in a building undergoing a gut rehabilitation) on the interior side of structural masonry or monolithic walls may not be able to complete this Item. In addition, other existing sill plates resting atop concrete or masonry and adjacent to conditioned space can in lieu of using a gasket, be sealed with caulk, foam, or equivalent material at both the interior seam between the sill plate and the subfloor and the seam between the top of the sill plate and the sheathing.

20. In Climate Zones 1 through 3, a continuous stucco cladding system adjacent to sill and bottom plates is an alternate option of sealing plates to foundation or sub-floor with caulk, foam, or equivalent material.

21. Recommended air leakage paths to be sealed include, but are not limited to the following:
   a. Plumbing penetrations, including those from water piping, drain waste and vent piping, HVAC piping, and gas line piping.
   b. Electrical penetrations, including those for receptacle outlets, lighting outlets/fixtures, communications wiring, thermostats, and smoke alarms.
   c. HVAC penetrations, including those for fans and for exhaust, supply, transfer, and return air ducts.
   d. Envelope penetrations, including at the intersection of baseboard trim and floor, at the intersection of walls and ceilings, around window trim and dwelling unit doors, including the door latch hole.

22. Window-to-Wall ratio is taken as the sum of all window area divided by the total exterior above-grade wall area. All decorative glass and skylight window area contribute to the total window area to above-grade wall ratio (WWR). Spandrel sections of curtain wall systems contribute to the above-grade wall area.

23. “FT Agents” must be a Certified Commissioning Professional (CCP), a Certified Building Commissioning Professional (CBCP), a Building Commissioning Professional (BCxP, formerly the Commissioning Process Management Professional (CPMP)), a NEBB Certified Technician (BSC CxCT) or Certified Professional (BSC CP or CxPP), a representative of the Original Equipment Manufacturer (OEM), or a contractor credentialed by an HVAC Quality Installation Training and Oversight Organization (H-QUITO). “FT Agents” may not be the installing contractor unless they are a credentialed contractor. An explanation of the credentialing process and links to H-QUITOs, which maintain lists of credentialed contractors, can be found at energystar.gov/newhomeshvac.
