

• Visit www.energyslar.gov/meetomestvag: for information about the credential requirement and this checklist. 1. Commissioning Overview 1.1 Contractor name 1.2 Organization that your company is credentialed with: 1.3 Builder client name: 1.4 Hone address: 1.5 National HVAC Design Report corresponding to this system has been collected from designer or builder. 1.6 Area that system serves, per lem 1.4 of National HVAC Design Report. 1.6 Area that system serves, per lem 1.4 of National HVAC Design Report. 1.7 House plan, per Item 1.6 of National HVAC Design Report. 2. Refrigerant Charge - Run system for 15 minutes before testing. If outdoor ambient temperature at the condense is 55°F or. 2. Refrigerant Charge - Run system for 15 minutes before testing. If outdoor ambient temperature share a condenser: 2.1 Outdoor ambient temperature and be recorded in flow 21, and the contractor shall check 'NA' in hils Section.* Ducked or non-ducked angle-packaged systems (i.e., PTAC) are exempt from this section. 2.1 Outdoor ambient temperature: *F DB 2.1 Outdoor ambient temperature: *F DB 2.2 Return-side air temperature: *F DB 2.3 Liquid line pressure: psig 2.4 Liquid line temperature: *F DB 2.6 Suction line temperature: *F DB 2.7 Condenser saturation temperature: *F DB 2.7 Condenser saturation temperature: *F DB (Using Item 2.3) 2.8 Subcooling deviation: *F DB (Item 2.7 - Item 2.4) 2.1 Subcooling deviation: *F DB (Item 2.6 - Item 2.13) 2.3 Subcooling deviation: *F DB (HVAC Commissioning Contractor Responsibilities: The commissioning contractor must be credentialed by an HVAC oversight organization to complete this checklist. One checklist must be completed and signed by the commissioning contractor for each HVAC system that is commissioned. The completed checklist for each commissioned system, along with the corresponding National HVAC Design Report, shall be retained by the contractor for a minimum of three years for quality assurance purposes. Furthermore, the contractor shall provide the completed checklist to the builder, the Rater ³ responsible for certifying the home, and the HVAC oversight organization upon request.

Footnotes

1. This Checklist is designed to align with the requirements of ANSI / ACCA's 5 QI-2015 protocol, thereby improving the performance of HVAC equipment in new homes when compared to homes built to minimum code. However, these features alone cannot prevent all ventilation, indoor air quality, and HVAC problems (e.g., those caused by a lack of maintenance or occupant behavior). Therefore, this Checklist is not a guarantee of proper ventilation, indoor air quality, or HVAC performance.

This Checklist applies to split air conditioners, unitary air conditioners, air-source heat pumps, and water-source (i.e., geothermal) heat pumps up to 65 kBtuh with forced-air distribution systems (i.e., ducts) and to furnaces up to 225 kBtuh with forced-air distribution systems (i.e., ducts). All other permutations of equipment (e.g., boilers, mini-split / multi-split systems) and distribution systems are exempt.

- 2. For a home certified in the State of ID, MT, OR, or WA, the following alternatives and exemptions apply:
 - a. For a home with an air-source heat pump up to 65 kBtuh with a forced-air distribution system (i.e., ducts), the contractor is permitted to complete the 2011 PTCS[®] Commissioned Heat Pump Certificate and Startup Form in lieu of this Checklist.
 - b. For a home with a split air conditioner or unitary air conditioner up to 65 kBtuh with a forced-air distribution system (i.e., ducts), the contractor is permitted to complete the Northwest Central AC Commissioning & Startup Form in lieu of this Checklist.
 - c. For a home in a location with < 600 CDD, the completion of this Checklist is recommended, but not required.
- 3. The term 'Rater' refers to the person(s) completing the third-party verification required for certification. The person(s) shall: a) be a Certified Rater or Approved Inspector, as defined by ANSI / RESNET / ICC 301, or an equivalent designation as determined by a Home Certification Organization (HCO); and, b) have attended and successfully completed an EPA-recognized training class. See www.energystar.gov/newhomestraining.
- 4. Either factory-installed or field-installed TXV's may be used. For field-installed TXV's, ensure that sensing bulbs are insulated and tightly clamped to the vapor line with good linear thermal contact at the recommended orientation, usually 4 or 8 o'clock.
- 5. Air balancing of supply registers and return grilles is highly recommended to improve the performance of the HVAC system and comfort of the occupants, but is not required at this time for certification. When air balancing is completed, balancing dampers or proper duct sizing shall be used instead of looped or coiled ductwork to limit flow to diffusers. When balancing dampers are used, they shall be located at the trunk to limit noise unless the trunk will not be accessible when the balancing process is conducted. In such cases, Opposable Blade Dampers (OBD) or dampers located in the duct boot are permitted to be used.

This collection of information is approved by OMB under the Paperwork Reduction Act, 44 U.S.C. 3501 et seq. (OMB Control No. 2060-0586). Responses to this collection of information are voluntary. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The public reporting and recordkeeping burden for this collection of information is estimated to be 0.5 hour per response. Send comments on the Agency's need for this information, the accuracy of the provided burden estimates and any suggested methods for minimizing respondent burden including through the use of automated collection techniques to the Director, Regulatory Support Division, U.S. Environmental Protection Agency (2821T), 1200 Pennsylvania Ave., NW, Washington, D.C. 20460. Include the OMB control number in any correspondence. Do not send the completed form to this address.
