

**Email received on January 14, 2011 from Kei Haraguchi.**

Dear Alex and Kate,

Nichia would like to propose about the sampling procedure for the LM-80, especially for choosing CCT.

[Sample size: following the current manufacturing guide for the current SSL E-Star] LED samples / condition => 25pcs LED array / condition => 10pcs

[Color]

Proposal 1: Due to saving test equipment resources, total cost and sampling time, the CCT of samples is NOT specified.

Proposal 2: Due to saving test equipment resources, total cost and sampling time, AND due to the major CCTs in lighting industry, the CCT of samples is either of 3500K, 3000K or 2700K.

If you have any questions, please let me know.

Best regards,  
Kei
