

Email received on January 25, 2010 from Yoshi Ohno.

I support the action proposed in this letter. 120 Hz is generally no problem of flicker, as experienced with discharge lamps with magnetic ballasts, unless there are lower frequency components in it (e.g., 60 Hz). Some people are concerned, though, about deeper modulation of LEDs, e.g., AC LEDs, that might cause stroboscopic effects. I think some visual experimental study may be needed to clarify on these questions.

Regards,
Yoshi
