I beg you to reject the 120Hz strobe specification. I am painfully aware of the strobing of LED lighting at 120Hz and much higher frequencies. I don't think I am a crack pot either. I don't have the extreme sensitivity to fluorescent lighting that has been reported in numerous studies. I also note that LED televisions now proudly advertise their 600Hz refreshing. I am a fan of LED lighting. LED's provide hard to obtain blues, save energy and have long life. Their prices continue to attract new applications. Flicker CRI and packaging are serious obstacles for their adoption.
