

We have the following comments on the pending changes to the Energy Star Luminaire specification.

Efficacy, Output and Zonal Lumen Density Requirements for Directional Luminaires

The outdoor wall, porch, and pendant mount luminaires are being added to the post-mount luminaire section for the directional luminaire. Will they also still remain under the residential non-directional category? Will you be able to qualify these fixture as either directional or residential non-directional?

Color Angular Uniformity Testing Guidance for SSL Downlights and Retrofits

Testing for SSL downlights and retrofits will be able to be tested without the trim in place. We have applications where we use decorative glass, is the glass considered a trim and can it be removed for testing? If the glass can be removed for testing, does this apply to downlights and retro-fits only? What about other applications, such as track heads and ceiling fan light kits?
