

Rebecca,

Our comment is as follows regarding item 394 “ Set-Point Temperature Requirements” of the Draft 1 Test Method. The average of all the thermocouples to achieve $\pm 1.5^{\circ}\text{C}$ would require the freezer to run almost 100% of the time. This obviously would cause the compressors to run more, use more energy, and thus defeat the purpose of Energy Star. Please drop this requirement from the test.
