

Dear Sir,

This is Zen Tseng from TPV Technology Group, and I have a comment about the 6.0 final draft specification as below:

In general, when using USB 2.x, energy consumption is always up to 0.8~1.0W even the monitor entering into Sleep mode.

Therefore, it would be impossible for compliance that the spec only add 0.5W for this extra connection.

TPV suggests if the add up power consumption of sleep mode for USB 2.x could be re-concern, thanks~

*Best regards,  
Zen Tseng*
