

Dear Sir,

After checked the test method of Energy Star 6.0 draft 1, we found there is a deviation for the speaker set up , as my know If the display with a speaker , and perform testing in the shipped power configuration , this will cause power consumption higher , could you please take this comments for discussion.

By the way ,, in the television test method, the volume should set up at minimum .

Br,

David

EPA Displays v5.1,

Built-in speakers, TV tuners, and other product features and functions not specifically addressed by the ENERGY STAR eligibility criteria or test method **may be configured in a minimum power configuration, as adjustable by the user.**

EPA Displays v 6.0 draft,

Built-in speakers, and other product features and functions not specifically addressed by the ENERGY STAR eligibility criteria or test method **must be configured in the as shipped power configuration.**
